EXECUTIVE SUMMARY

The soil removal actions at Paradise Point and Camp Johnson were completed in the vicinity of former fuel oil underground storage tanks that were previously removed and was initiated in response to a soil assessment performed by CATLIN Engineers and Scientists in the spring of 2003. Results of the assessments were presented in reports dated May and June 2003. Volatile and semi-volatile organic compounds as well as MADEP EPH/VPH constituents were found in the soil surrounding the former tank locations at concentrations above the North Carolina Residential Maximum Soil Contaminant Concentrations.

The following work was accomplished at the site during March 2003:

- Excavation of 130 tons of non-hazardous TPH impacted soil from four locations at Paradise Point.
- Excavation of 95 tons of non-hazardous TPH impacted soil from one location at Camp Johnson.
- Collection of 5 initial confirmation samples from each of the locations for TPH-DRO and TPH-GRO analysis.
- Re-excavation at House PP-3326 and M-230, and collection of 5 final confirmation samples for MADEP-EPH and MADEP-VPH analysis.
- Using a hand auger, collection of 5 final confirmation samples from each of the other locations for MADEP-EPH and MADEP-VPH analysis.
- Collection of 1 confirmation sample from each of the locations for VOCs Method 8260 and SVOCs Method 8270 analysis.
- Collection of one composite sample for Toxicity Characteristic Leaching Procedure analysis for disposal purposes.
- Restoration of each site by backfilling, compacting, grading, seeding and mulching the affected area.
- Transportation to and disposal of soil at an in-State petroleum permitted disposal facility.

During soil removal activities only the excavation at House PP-3326 displayed visible hydrocarbon contamination. Over excavation removed the hydrocarbon stained soil. The depth of excavations at Paradise Point extended to five feet below land surface. Groundwater was observed in the excavation at House PP-3326.

Confirmation soil samples indicated that at least one sample from each excavation exceeded the North Carolina Department of Environmental and Natural Resources Residential MSCCs for hydrocarbon constituents.

For disposal purposes, a sample from the excavated soils was analyzed for full TCLP analyses, TPH-GRO, TPH-DRO, and general chemical analysis. Results from these analyses met the allowable State disposal levels. The soils were disposed at ES&J Enterprise, Inc. located in Autryville, NC.

1.0 INTRODUCTION

1.1 BACKGROUND

This document is a summary report describing soil removal actions completed at Buildings PP-3326, PP-3330, PP-3332, and PP-3350 located at Paradise Point and Building M-230 located at Camp Johnson, Marine Corps Base Camp Lejeune during April and May of 2004. The Department of the Navy, Naval Facilities Engineering Command, Atlantic Division (LANTDIV) tasked Shaw Environmental, Inc. to implement this removal action under Contract No. N62470-02-D-3260, Task Order 023.

This report contains five sections and six appendices: Section 1.0 is an introduction, Section 2.0 is a description of the remedial activities, Section 3.0 presents a summary of analytical results, Section 4.0 presents a summary of field activity and conclusions, and Section 5.0 provides references.

1.2 ENVIRONMENTAL SETTING

MCB Camp Lejeune is located in Onslow County, North Carolina. MCB Camp Lejeune is a training base for the United States Marine Corps. The Base covers approximately 236 square miles and includes 14 miles of coastline. MCB Camp Lejeune is bounded to the southeast by the Atlantic Ocean and the northeast by State Route 24. **Figure 1-1** presents a portion of MCB in the vicinity of Paradise Point and Camp Johnson.

1.3 SITE DESCRIPTIONS

Paradise Point is a residential housing complex located in the north-northeast portion of the MCB. Camp Johnson is located northwest (across the New River) from Paradise Point.

1.3.1 House PP-3326

The UST and associated pipe was removed from this location in October 2001. Four of the five confirmation soil samples collected during UST closure exceeded the State Residential Maximum Soil Contaminant Concentrations (MSCCs). The subsequent Phase I LSA was conducted by CATLIN in July 2002 with additional sampling performed in March 2003. The subsequent investigations (Phase I LSA and SAR) yielded the following findings:

- The site is classified as Residential and Low Risk.

- Free product was not observed in the subsurface at the site.
- Dissolved hydrocarbons were discovered in groundwater at the site, however, no concentrations were detected in excess of Gross Contaminant Levels (GCLs).
- The extent of soil contamination was delineated and appeared to be limited to the immediate vicinity of the former tank basin to a depth of two feet below land surface (bls).

Due to the apparent limited extent of soil contamination, soils with contaminant concentrations in excess of Residential MSCCs were proposed for excavation. An estimated 12 cubic yards (cy) were expected to require removal and disposal.

1.3.2 House PP-3330

The UST system was removed at this location by J.A. Jones in September 2001. All five confirmation soil samples collected during UST closure exceeded the State Residential MSCCs. The subsequent Phase I LSA was conducted by CATLIN in July 2002 with additional sampling performed in March 2003. The subsequent investigations (Phase I LSA and SAR) yielded the following findings:

- The site is classified as Residential and Low Risk.
- Free product was not observed in the subsurface at the site.
- Dissolved hydrocarbons were discovered in groundwater at the site, however, no concentrations were detected in excess of GCLs.
- The extent of soil contamination was delineated and appeared to be limited to the immediate vicinity of the former tank basin to a depth of three feet bls.

Due to the apparent limited extent of soil contamination, soils with contaminant concentrations in excess of Residential MSCCs were proposed for excavation. An estimated 26 cy were expected to require removal and disposal.

1.3.3 House PP-3332

This UST was removed in September 2001. Four confirmation soil samples collected during UST closure exceeded the State Residential MSCCs. The subsequent Phase I LSA was conducted by CATLIN in July 2002 with additional sampling performed in March 2003. The subsequent investigations (Phase I LSA and SAR) yielded the following findings:

- The site is classified as Residential and Low Risk.

- Free product was not observed in the subsurface at the site.
- Dissolved hydrocarbons were discovered in groundwater at the site, however, no concentrations were detected in excess of GCLs.
- The extent of soil contamination was delineated and appeared to be limited to the immediate vicinity of the former tank basin to a depth of 3.5 feet bls.

Due to the apparent limited extent of soil contamination, soils with contaminant concentrations in excess of Residential MSCCs were proposed for excavation. An estimated 28 cy were expected to require removal and disposal.

1.3.4 House PP-3350

This UST was removed by J.A. Jones in September of 2001. Three of the five confirmation soil samples collected during UST closure exceeded the State Residential MSCCs. The subsequent Phase I LSA was conducted by CATLIN in July 2002 with additional sampling performed in March 2003. The subsequent investigations (Phase I LSA and SAR) yielded the following findings:

- The site is classified as Residential and Low Risk.
- Free product was not observed in the subsurface at the site.
- Dissolved hydrocarbons were discovered in groundwater at the site, however, no concentrations were detected in excess of GCLs.
- The extent of soil contamination was delineated and appeared to be limited to the immediate vicinity of the former tank basin to a depth of two feet bls.

Due to the apparent limited extent of soil contamination, soils with contaminant concentrations in excess of Residential MSCCs were proposed for excavation. An estimated 6 cy were expected to require removal and disposal.

1.3.5 Building M-230 (Camp Johnson)

Building M-230 is a steam generation facility for Camp Johnson in Camp Lejeune, North Carolina. Two 15,000 gallon diesel fuel oil USTs used for steam generation were removed in September 1993. Following completion of UST removal activities, an UST Closure Assessment and a Limited Site Assessment were completed. Results of these assessments identified three SVOCs (benzo(a)anthracene, benzo(a)pyrene, and benzo(b)fluoranthene) at concentrations above the Residential MSCCs. Based on the initial site assessment results a Soil Assessment Report (SAR) was completed in March 2003. Results of these investigations are summarized below:

- The site is classified as Residential and Low Risk.
- Free product was not observed in the subsurface at the site.
- The extent of soil contamination was delineated and appeared to be limited to the immediate vicinity of Monitoring Well M230-MW1.

Due to the apparent limited extent of soil contamination, soils with contaminant concentrations in excess of Residential MSCCs were proposed for excavation. An estimated 6 cy were expected to require removal and disposal.

2.0 REMEDIAL ACTIVITIES

2.1 REMEDIAL ALTERNATIVE

Based on findings of soil assessment activities at each site, it was determined that the limits of hydrocarbon contamination at each site had been delineated. Soil contamination was assumed to be limited to the areas adjacent to the sidewalls of the former tank basin. Because of the relative small quantity of contaminated soil, on-site treatment was not practical for this project. Therefore, soil excavation and disposal was determined to be the most cost-effective technology for remediation of POL contaminated soils at each site. The remedial approach at each site was to excavate and dispose petroleum contaminated soil in the vicinity of the former USTs, as defined by Catlin's soil assessment report and the Soil Removal Action Work Plan for each site.

2.2 SITE REMEDIATION CHRONOLOGY

The following activities were completed during implementation of the soil removal action:

- All excavation activities were completed using a mini excavator.
- Removal of POL contaminated soil at House PP-3326 over an approximate area of 186 ft² to a depth of 5 bls (35 cy).
- Removal of POL contaminated soil at House PP-3330 over an approximate area of 144 ft² to a depth of 5 feet bls (27 cy).
- Removal of POL contaminated soil at House PP-3332 over an approximate area of 156 ft² to a depth of 5 feet bls (29 cy).
- Removal of POL contaminated soil at House PP-3350 over an approximate area of 36 ft² to a depth of 5 feet bls (7 cy)
- Abandonment of Monitoring Well M230-MW1 at Building M-230
- Removal of POL contaminated soil at Building M-230 over an approximate area of 176 ft² to a depth of 11 feet bls (72 cy).
- Collection of confirmation and disposal soil samples.
- Restoration of affected areas.
- Disposal of contaminated soil at an appropriate facility.

Following completion of initial excavation activities, sidewall and floor confirmation soil samples were collected for TPH-DRO and TPH-GRO analysis. If analytical results exceeded 10 mg/kg a second confirmation soil sample was collected and analyzed for MADEP

EPH/VPH. In addition, the soil sample with the highest OVA-FID reading from each excavation was also analyzed for VOCs (Method 8260) and SVOCs (Method 8270). The remedial objectives were based on soil contaminant concentrations that exceeded the State Residential MSCCs for VOCs, SVOCs and MADEP EPH/VPH. Soils were disposed of at a permitted, in-State Non-Hazardous RCRA Subtitle D disposal facility.

April 26-27, 2004: Site Preparation. Equipment and personnel currently working at Camp Lejeune performed this remedial project. The initial site preparation activities included:

- Acquiring dig permits and proper safety forms.
- Examining each site to determine access to the proposed excavation area.
- Delineation of each job site perimeter and work zones.
- Location of all utilities within the project area.
- Placement of a mini-excavator into the excavation area.
- Designating a soil staging area.
- Placement of temporary fence/barricades surrounding each work area.
- Procurement of required equipment and materials.

Setting up an exclusion zone and implementing erosion and sedimentation control measures, such as silt fence and hay bale placement, were not necessary for these field activities.

Prior to excavation activities a local utility locator, contracted by Shaw, identified and marked known utilities within each work zone.

Project kick-off and Health & Safety Meeting. All site personnel were informed of the project objectives. Site hazards and contaminants of concern were discussed.

April 28, 2004: Soil Removal, House PP-3326. During excavation activities the sidewall of the excavation was screened with a Flame Ionization Detector (OVA-FID). Field measurements ranged from 0 ppm to 364 ppm. The original soil removal area was excavated in one day. Since the excavations were taking place within a residential area, the contaminated soil was transported by dump truck to a secured area and covered while awaiting disposal. The initial excavation area was approximately 64-ft² (8 ft x 8 ft) to a depth of 5 feet bls.

Based on visual observation of stained soil and elevated OVA-FID readings the excavation was expanded approximately six feet on either side of the excavation and one foot on the side

away from the house. The dimensions of the final excavation were approximately 20 feet x 9 feet x 5 feet deep (33 cy). Four sidewall samples were collected for TPH-DRO/GRO analysis. The final excavated area is shown in **Figure 2-1** and a series of photographs are provided in **Appendix A**.

Groundwater and some product were observed in the bottom of the excavation. The fluids were recovered using a vacuum recovery truck. Because groundwater was encountered in the bottom of the excavation, a confirmation soil sample was not collected from the bottom of the excavation.

Routine air monitoring in the breathing zone was performed during excavation activities using an OVA-FID to monitor for the presence of volatile hydrocarbons. No readings were detected in the breathing zone above the ambient level of 0.0 parts per million (ppm); therefore no upgrade in protective equipment was required.

April 29, 2004: Soil Removal, House PP-3330. During excavation activities the sidewall of the excavation was screened with an OVA-FID. Field measurements ranged from 0 ppm to 20 ppm. No visible soil staining or hydrocarbon odors were observed during excavation activities. Excavated soil was transported to a secure area and covered while awaiting disposal. The excavated area is shown in **Figure 2-2** and a series of photographs are provided in **Appendix A**. An approximate area of 144-ft² (12 ft x 12 ft) was excavated to a depth of 5 feet bls (27 cy). Groundwater was not observed in the bottom of the excavation. Four sidewall samples and one bottom sample were collected for TPH-DRO/GRO analysis.

Routine air monitoring in the breathing zone was performed during excavation activities using an OVA-FID to monitor for the presence of volatile hydrocarbons. No readings were detected above the ambient level of 0.0 ppm; therefore no upgrade in protective equipment was required.

April 30, 2004: Site Restoration, Houses PP-3326 and PP-3330. The excavations at House PP-3326 and PP-3330 were backfilled and compacted in 2 feet lifts. Locator tape was placed 2 feet above the underground utilities (electrical and telephone) identified during excavation activities. Final restoration was completed by placing sod on the backfilled excavation.

May 6, 2004: Soil Removal, Houses PP-3332 and PP-3350. During excavation activities the sidewall of the excavation was screened with an OVA-FID. Field measurements ranged from 0 ppm to 20 ppm. No visible soil staining or hydrocarbon odors were observed during

excavation activities. Excavated soil was transported by dump truck to a secured area and covered while awaiting disposal. The excavated areas are shown in **Figures 2-3 and 2-4**. Photographs are provided in **Appendix A**. At House PP-3332 an approximate area of 156-ft² (12 ft x 13 ft) was excavated to a depth of 5 feet bls (30 cy). At House PP-3350 an approximate area of 36-ft² (6 ft x 6 ft) was excavated to a depth of 5 feet bls (7 cy). Groundwater was observed in the bottom of the excavation at House PP-3332. Four sidewall samples and one bottom sample were collected for TPH-DRO/GRO analysis from each excavation.

Routine air monitoring in the breathing zone was performed during excavation activities using an OVA-FID to monitor for the presence of volatile hydrocarbons. No readings were detected above the ambient level of 0.0 parts per million (ppm); therefore no upgrade in protective equipment was required.

May 7, 2004: Houses PP-3332 and PP-3350 Site Restoration. The excavations at House PP-3332 and PP-3350 were backfilled and compacted in 2 foot lifts. Final restoration was completed by placing sod on the backfilled excavations.

May 10, 2004: Camp Johnson Building M-230 Excavation. Monitoring Well M230-MW1 was properly abandoned by a North Carolina registered driller on April 30, 2004. A copy of the monitoring well abandonment form is provided in **Appendix B**. Excavation activities removed soil (as well as the abandoned monitoring well) in a 5 feet radius around the monitoring well to a total depth of 8 feet bls. Four sidewall samples and one bottom sample were collected for TPH-DRO/GRO analysis from the excavation.

May 20-21, 2004: Camp Johnson Building M-230 Additional Excavation. Based on TRPH-GRO/DRO analytical results exceeding 10 mg/kg in two sidewall samples and the floor sample, the excavation was extended an additional 2.5 feet around the monitoring well (15 feet total diameter) and an additional 3 feet deep (11 feet total depth). At the conclusion of the additional excavation work, two confirmation sidewall soil samples and one floor soil sample were collected. The samples were analyzed for VOCs (Method 8260), SVOCs (Method 8270) and MADEP EPH/VPH.

May 26, 2004: Paradise Point Soil Confirmation Sample Collection Houses PP-3326, PP-3330, PP-3332, and PP-3350. Using a hand auger, confirmation soil samples were collected approximately two feet from each excavation sidewall and a floor sample was collected from the center of each excavation. The samples were collected from a depth of seven feet bls. A

floor sample was not collected at House PP-3326 because groundwater was encountered at a depth of five feet bls during excavation activities. All the soil samples were analyzed for MADEP EPH/VPH. In addition, the soil sample displaying the highest OVA-FID reading from each excavation was analyzed for VOCs (Method 8260) and SVOCs (Method 8270).

Transport and Disposal of Contaminated Soil. A total of 254 tons of soil was loaded onto trucks and transported and disposed of by ES&J Enterprises. ES&J Enterprise operates a State-permitted TPHC recycling facility located in Autryville, North Carolina. Manifests were obtained from ES&J Enterprises and are included in **Appendix C**.

The Safety Meeting Reports, Job Safety Analyses Forms, Excavation Inspection Report, and field notes are presented in **Appendix D**.

3.0 POST EXCAVATION SOIL SAMPLE ANALYTICAL RESULTS

3.1 NORTH CAROLINA REGULATORY STANDARDS

The remedial action cleanup criteria for the Paradise Point and Camp Johnson soils were based on the NCDENR Maximum Soil Contaminant Concentrations for Residential Soil Cleanup Levels established in the April 2001 guidelines.

3.2 CONFIRMATION SAMPLING

Following initial excavation activities, confirmation soil samples were collected and sent to an off-site laboratory for TPH-DRO and TPH-GRO analysis. When analytical results exceeded 10 mg/kg, additional soil removal was completed and an additional set of confirmation samples were collected. These confirmation soil samples were analyzed for MADEP EPH/VPH, EPA Method 8260B, and EPA Method 8270 analysis according to the Sampling and Analysis Plan, *Appendix B of the Soil Removal Action Work Plan for Paradise Point POL Remedial Measures Houses PP-3326, PP-3330, PP-3332, PP-3350 and Building M-230, dated April 2004*. The following sections present analytical results from each of the excavations.

3.2.1 House PP-3326

Analytical results indicated that TPH-DRO and TPH-GRO were detected at concentrations above 10 mg/kg in soil samples 3326-NW-001 (30,700 mg/kg, TPH-DRO; 676 mg/kg, TPH-GRO) and 3326-EW-003 (61.7 mg/kg, TPH-DRO). **Table 3.1** presents TPH-GRO/DRO analytical results.

Analytical results indicated that some VOC and SVOC constituents were detected at very low concentrations in soil sample 3326-WW-004. The concentrations of these constituents were, however, below North Carolina's Residential MSCCs. Only 2-methylnaphthalene (3.14 mg/kg) was detected at a concentration slightly above the Soil-to-Groundwater MSCC (3.0 mg/kg). **Table 3.2** presents VOC and SVOC analytical results.

Analytical results indicated that some MADEP EPH/VPH carbon ranges were detected at concentrations in soil samples 3326-NW-001, 3326-SW-002 and 3326-WW-004. The C9-C18 Aliphatics concentration (18,100 mg/kg) exceeded the Residential MSCC in sample 3326-WW-004. The C9-C22 Aromatics concentration exceeded the Residential MSCC in samples 3326-NW-001 (3,429 mg/kg) and 3326-WW-004 (4,183 mg/kg). **Table 3.3** presents

MADEP EPH/VPH analytical results. **Table 3.13** presents a summary table of the MADEP EPH/VPH analytical results. The laboratory analytical reports are provided in **Appendix E**.

3.2.2 House PP-3330

Analytical results indicated that TPH DRO and TPH-GRO were detected at concentrations above 10 mg/kg in soil samples 3330-NW-001 (78.9 mg/kg, TPH-DRO), 3330-SW-002 (4,970 mg/kg, TPH-DRO) and 3330-F-005 (16,200 mg/kg, TPH-DRO; 99.5 mg/kg, TPH-GRO). **Table 3.1** presents TPH-GRO/DRO analytical results.

Analytical results did not detect any VOC or SVOC constituents above the method reporting limit in soil sample 3330-SW-002. The method reporting limit was below both North Carolina's Residential MSCCs as well as the Soil-to-Groundwater MSCCs for all the constituents in each analytical method with the exception of benzo(a)pyrene. **Table 3.4** presents VOC and SVOC analytical results.

Analytical results indicated that some MADEP EPH/VPH carbon ranges were detected at concentrations in soil samples 3330-NW-001, 3330-WW-004, and 3330-F-005. The C9-C22 Aromatics concentration exceeded the Residential MSCC in samples 3330-NW-001 (769 mg/kg) and 3330-WW-004 (9,120 mg/kg). The C9-C18 Aliphatics concentration exceeded the Residential MSCC in sample 3330-WW-004 (11,400 mg/kg). **Table 3.5** presents MADEP EPH/VPH analytical results. **Table 3.13** presents a summary table of the MADEP EPH/VPH analytical results. The laboratory analytical reports are provided in **Appendix E**.

3.2.3 House PP-3332

Analytical results indicated that TPH DRO and TPH-GRO were detected at concentrations above 10 mg/kg in soil samples 3332-NW-001 (16.1 mg/kg, TPH-DRO), 3332-SW-002 (3,720 mg/kg, TPH-DRO), 3332-WW-004 (17.4 mg/kg, TPH-DRO) and 3332-F-005 (13,500 mg/kg, TPH-DRO; 130 mg/kg, TPH-GRO). **Table 3.1** presents TPH-GRO/DRO analytical results.

Analytical results indicated that some VOC and SVOC constituents were detected at very low concentrations in soil sample 3332-SW-002. The concentrations of these constituents were, however, below North Carolina's Residential MSCCs. Only 2-methylnaphthalene (14.1 mg/kg) and naphthalene (4.52 mg/kg) were detected at concentrations above their respective Soil-to-Groundwater MSCCs (2-methylnaphthalene, 3.0 mg/kg; and naphthalene, 0.58 mg/kg). **Table 3.6** presents VOC and SVOC analytical results.

Analytical results indicated that some MADEP EPH/VPH carbon ranges were detected at concentrations in soil samples 3332-NW-001, 3332-SW-002, 3332-WW-004, and 3332-F-005. The C9-C22 Aromatics concentration exceeded the Residential MSCC in samples 3332-NW-001 (5,438 mg/kg), 3332-SW-002 (1,848 mg/kg), and 3332-F-005 (1,232 mg/kg). The C9-C18 Aliphatics concentration exceeded the Residential MSCC in sample 3332-NW-001 (14,600 mg/kg). **Table 3.7** presents MADEP EPH/VPH analytical results. **Table 3.13** presents a summary table of the MADEP EPH/VPH analytical results. The laboratory analytical reports are provided in **Appendix E**.

3.2.4 House PP-3350

Analytical results indicated that TPH DRO and TPH-GRO were detected at concentrations above 10 mg/kg in soil samples 3350-EW-003 (83.3 mg/kg, TPH-DRO), 3350-WW-004 (68.8 mg/kg, TPH-DRO) and 3350-F-005 (16,800 mg/kg, TPH-DRO). **Table 3.1** presents TPH-GRO/DRO analytical results.

Analytical results did not detect any VOC or SVOC constituents above the method reporting limit in soil sample 3350-WW-004. The method reporting limit was below both North Carolina's Residential MSCCs as well as the Soil-to-Groundwater MSCCs for all the constituents in each analytical method with the exception of benzo(a)pyrene. **Table 3.8** presents VOC and SVOC analytical results.

Analytical results indicated that some MADEP EPH/VPH carbon ranges were detected at concentrations in soil samples 3350-NW-001, 3350-SW-002, 3350-EW-003, 3350-WW-004, and 3350-F-005. The C9-C22 Aromatics concentration exceeded the Residential MSCC in samples 3350-NW-001 (512 mg/kg), 3350-SW-002 (1,207 mg/kg), and 3350-F-005 (2,850 mg/kg). **Table 3.9** presents MADEP EPH/VPH analytical results. **Table 3.13** presents a summary table of the MADEP EPH/VPH analytical results. The laboratory analytical reports are provided in **Appendix E**.

3.2.5 Building M-230

Analytical results indicated that TPH DRO and TPH-GRO were detected at concentrations above 10 mg/kg in soil samples M230-NW-001 (71.1 mg/kg, TPH-DRO), M230-WW-004 (63 mg/kg, TPH-DRO) and M230-F-005 (341 mg/kg, TPH-DRO). **Table 3.1** presents TPH-GRO/DRO analytical results.

Analytical results indicated that some VOC and SVOC constituents were detected at very low concentrations in soil samples M230-NW-001 and M230-F-005. The concentrations of these constituents were, however, below North Carolina's Residential MSCCs with the exception of benzo(a)pyrene (0.256 mg/kg) in sample M230-F-005. Only benzo(a)pyrene was detected at a concentration above the Soil-to-Groundwater MSCC of 0.091 mg/kg. **Table 3.10** presents VOC and SVOC analytical results.

Analytical results indicated that some MADEP EPH/VPH carbon ranges were detected at concentrations in soil samples M230-NW-001 and M230-F-004. The concentrations of these constituents were, however, below North Carolina's Residential MSCCs. Only the C9-C22 Aromatics in samples M230-NW-001 (34.5 mg/kg) and M230-F-004 (42.4 mg/kg) were detected at concentrations above the Soil-to-Groundwater MSCC (34 mg/kg). **Table 3.11** presents MADEP EPH/VPH analytical results. **Table 3.13** presents a summary table of the MADEP EPH/VPH analytical results. The laboratory analytical reports are provided in **Appendix E**.

3.3 DISPOSAL SAMPLING

The contaminant concentrations for the composite soil sample were below laboratory detection limit for VOC TCLP, SVOC TCLP, pesticide TCLP, and herbicide TCLP analyses (**Table 3.12**). TPH results for composite GRO and DRO analyses were 195 mg/kg and 7,230 mg/kg respectively. The soil was determined to be non-hazardous and disposed of at ES&J Enterprises, Inc. facility located in Autryville, North Carolina. The non-hazardous waste shipping documents are provided in **Appendix C**. The laboratory analytical reports for TCLP results and TPH analyses are presented in **Appendix F**.

4.0 SUMMARY AND CONCLUSIONS

Approximately 130 tons of POL contaminated soil was removed to eliminate a source of petroleum contamination from four locations at Paradise Point. An additional 95 tons of POL contaminated soil was removed from one location at Camp Johnson. The soil contained elevated levels of constituents of fuel oil. The following conclusions have been developed based on results from the remedial action:

- The remedial action was successful in removing a majority of soil contaminated with petroleum hydrocarbons in the unsaturated zone at each location. However, confirmation soil sample analytical results indicate some hydrocarbon constituents continue to persist at concentrations above the Residential NCDENR soil cleanup levels at the Paradise Point sites.
- House PP-3326: Soil samples from the sidewall adjacent to the house (3326-NW-001) and the sidewall to the left (as you face the house) (3326-WW-004) exceeded Residential MSCCs for at least one constituent.
- House PP-3330: Soil samples from the sidewall adjacent to the house (3330-NW-001) and the sidewall to the left (as you face the house) (3330-WW-004) exceeded Residential MSCCs for at least one constituent.
- House PP-3332: Soil samples from the sidewall adjacent to the house (3330-NW-001), the sidewall farthest from the house (3332-WW-002) and the floor sample (3332-F-005, 5 feet bls) exceeded Residential MSCCs for at least one constituent.
- House PP-3350: Soil samples from the sidewall adjacent to the house (3350-NW-001), the sidewall on the other side of the excavation (3350-SW-002) and the floor sample (3350-F-005, 5 feet bls) exceeded Residential MSCCs for at least one constituent.
- Because of the proximity of the houses to the excavation, additional soil removal is not possible in the direction of the house.
- Building M-230: Only Floor sample M230-F-005 detected any hydrocarbon constituents (benzo(a)pyrene) above Residential MSCCs. This sample was collected from an approximate depth of 11 feet bls.

- Additional soil removal activities are required at locations that exceeded Residential MSCCs with the exception of those locations that are adjacent to the house.

Monitoring Well M230-MW1 Abandonment Form

North Carolina Department of Environment and Natural Resources-Division of Water Quality-Groundwater Section-1636 Mall Service Center
Raleigh, N.C. 27699-1639 Phone No. (919) 733-3221

M230 MW-1
WELL ABANDONMENT RECORD

Well Contractor: MANN DRILLING COMPANY
Well Contractor Certification # 2156

1. WELL USE (check applicable box) residential municipal industrial agricultural x monitoring recovery
Heat pump water injection other if other, list use: _____

2. WELL LOCATION: (show a sketch of the location on back of form)

Nearest Town: CAMP JOHNSON County: ONSLOW

TAFT ST. BLDG. M230 STEAM PLANT
(Road, community, Subdivision, Lot No.)

3. OWNER: COMMANDING GENERAL

4. ADDRESS: PO BOX 8006 CAMP LEJUENE NC 28547

5. TOPOGRAPHY: draw, slope, hilltop, valley, flat (flat)

6. TOTAL DEPTH: 17.3 DIAMETER: 2

7. CASING REMOVED:

Feet	diameter
7.3'	2
1.0' Screen	2

8. DISINFECTION: 2 OZ.

(amount of 70% hypochlorite used)

SEALING MATERIAL:

Neat cement	sand cement
Bags of cement: _____	bags of cement _____
Gals. Of water: _____	yds. Of sand _____
	Gals. Of water _____

OTHER:

Type material: BENTONITE GROUT
Amount: 4 GALLONS

10. EXPLAIN METHOD EMPLACEMENT OF MATERIAL:

TREMIE PIPE TO BOTTOM OF WELL, PUMPED GROUT TO SURFACE.

11. DATE WELL ABANDONED: 4/30/04

I do hereby certify that this well was abandoned in accordance with 15A NCAC 2C, well construction Standards, and that a copy of the record has been provided to the well owner.

Signature of person abandoning the well [Signature] Date 5-3-04

WELL LOCATION:

Draw a location sketch on the reverse of this sheet, showing the direction and distance of the well to at least two (2) nearby reference points such as roads, intersections and streams. Identify roads with State Highway road identification numbers.

Submit original to the Division of Water Quality, Groundwater section, one copy to the owner within 30 days from completion of abandonment. GW-30 Revised 12/99

Quadrangle No.

WELL DIAGRAM: Draw a detailed sketch of The well showing total depth, depth and diameter of screens remaining in the well, gravel intervals, intervals of casing perforations, and depths and types of fill materials used.

HOLE TO BE BACKFILLED W/ CLEAN SOIL AFTER EXCAVATION

CLIENT TO CUT OFF WELL AT BOTTOM OF EXCAVATION

	WORK COMPLIES WITH SAFETY REQUIREMENTS	☒	☐	
DEFINABLE FEATURES OF WORK AND WORK CONDUCTED:				
work: Preparatory meeting for contaminated soil excavation of Houses PP-3326, 3330, 3332, 3350. Holes will be in close proximity to homes so any open excavation will be barricaded off to prevent injuries. No soil will be stockpiled ~~on~~ in yards, but will be transported to lot 203 for sampling and disposal. Care will be taken not to damage any of the homeowners properties and environmental intrusions with equipment will be minimal. Proper PPE will be worn at all times, and crew will use ^{proper} safety procedures while executing these excavations. Soil samples will be taken as soon as each hole is complete so that the backfill process can be handled to restore the yards. Work will begin with house # 3326, an excavation of 8'x8'x5' deep.

SITE NAME: <u>Paradise Point</u>		T.O. # <u>102420</u>		<u>4/29/04</u>
PHASE	(BLANK NOT APPLICABLE)	YES	NO	IDENTIFY DEFINABLE FEATURE OF WORK, SPECIFICATION SECTION, LOCATION AND LIST PERSONNEL PRESENT
				TESTING PERFORMED & WHO PERFORMED TEST
WORK COMPLIES WITH CONTRACT AS APPROVED INITIAL PHASE	☒	☐	sampling: Deborah Hoyt collects samples from #3326 and #3330	
WORK COMPLIES WITH SAFETY REQUIREMENTS	☒	☐	FID samples with FID instrument C. McTier, Deborah Hoyt	
DEFINABLE FEATURES OF WORK AND WORK CONDUCTED:				
work: Repair phone line again at #3326. Use vac truck to remove ground water and product from bottom of hole at #3326. Take FID readings at #3326, hits are anywhere from 25 ppm up to 467 ppm (see sample chart.) Pull samples per direction of base inspector on 4 sidewalls, does not want one from the floor since there is groundwater there. #3330: Excavate 12' x 12' x 5' hole as directed by specs. Not only visible staining and just a few surface hits with FID. Complete the excavation and pull samples on 4 sidewalls and one on the bottom of the excavation. Base Inspector wants samples on today and both holes backfilled and compacted by the end of business 4/30/04.

Water removal equipment monitored by a competent person.			✓
Surface water or runoff diverted or controlled to prevent accumulation in the excavation.			✓
Inspections made after every rainstorm or other hazard-increasing occurrence.			✓
5. HAZARDOUS ATMOSPHERE:			
Atmosphere within the excavation tested where there is a reasonable possibility of an oxygen deficient, combustible, or otherwise hazardous atmosphere.			✓
Adequate precautions taken to protect employee from exposure to a hazardous atmosphere.	✓		
Testing conducted to ensure that the atmosphere remains safe.			✓
Emergency equipment, such as breathing apparatus, safety harness and line, and basket stretcher readily available where hazardous atmosphere does exist.			✓
6. SUPPORT SYSTEMS:			
Materials and/or equipment for support systems selected based on soil analysis, trench depth, and expected loads.	✓		
Materials and equipment used for protective systems inspected and in good condition.	✓		
Damaged materials and equipment used for protective systems inspected by a Registered Professional Engineer after repairs and before being placed back into service.	✓		
Protective systems installed without exposing employees to the hazards of cave-ins, collapses, or from being struck by materials or equipment.	✓		
Members of support systems securely fastened to prevent failure.	✓		
Support systems provided to insure stability of adjacent structures, buildings, roadways, sidewalks, walls, etc.	✓		
Excavations below the level of the base or footings approved by a registered professional engineer.			✓
Removal of support systems progresses from the bottom, and members are released slowly as to note any indication of possible failure.	✓		
Excavation of material to a level of greater than 2 feet below the bottom of the support system and only if the system is designed to support the loads calculated for the full depth.	✗		✓
Shield system placed to prevent lateral movement.	✗		✓
Employees are prohibited from remaining in shield system during vertical movement.

Technical Report for

Shaw E & I, Inc.

Camp Lejeune-Paradise Point 3326

102420

Accutest Job Number: F24414

Sampling Date: 05/26/04

Report to:

Shaw E & I, Inc.

natasha.sullivan@shawgrp.com

ATTN: Natasha Sullivan

Total number of pages in report: 53

Test results contained within this data package meet the requirements of the National Environmental Laboratory Accreditation Conference and/or state specific certification programs as applicable.

Harry Behzadi, Ph.D.
Laboratory Director

Certifications: FL (DOH E83510), NC (573), NJ (FL002), MA (FL946), IA (366), LA (03051), KS (E-10327), SC, AK
This report shall not be reproduced, except in its entirety, without the written approval of Accutest Laboratories.

Technical Report for

Shaw E & I, Inc.

Camp Lejeune-Paradise Point 3326

102420

Accutest Job Number: F24342

Sampling Date: 05/21/04

Report to:

Shaw E & I, Inc.

natasha.sullivan@shawgrp.com

ATTN: Natasha Sullivan

Total number of pages in report: 49

Test results contained within this data package meet the requirements of the National Environmental Laboratory Accreditation Conference and/or state specific certification programs as applicable.

Harry Behzadi, Ph.D.
Laboratory Director

Certifications: FL (DOH E83510), NC (573), NJ (FL002), MA (FL946), IA (366), LA (03051), KS (E-10327), SC, AK
This report shall not be reproduced, except in its entirety, without the written approval of Accutest Laboratories.

CAS No.	Compound	Result	HW#	MCL	RL	Units	Q
94-75-7	2,4-D	ND	D016	10	0.10	mg/l	
93-72-1	2,4,5-TP (Silvex)	ND	D017	1.0	0.010	mg/l	

(a) Analyzed By Accutest Southeast Subcontract Lab.

ND = Not detected

MCL = Maximum Contamination Level (40 CFR 261.6/96)

E = Indicates value exceeds calibration range

J = Indicates an estimated value

B = Indicates analyte found in associated method blank

N = Indicates presumptive evidence of a compound
