Annual Monitoring Report
Request for No Further Action Status

Task Order No. 067h

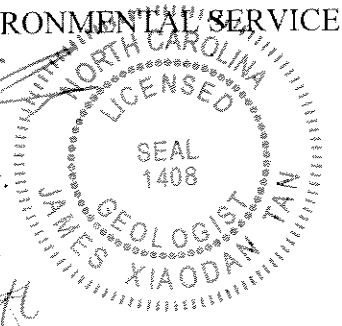
Soil Remediation
Building LCH-4022
Marine Corps Base
Camp Lejeune, North Carolina

The material and data in this Annual Monitoring Report and Request for No Further Action Status were prepared under the direction of the undersigned.

J.A. Jones Environmental Services Company is submitting this Annual Monitoring Report to the Navy as required under contract N62470-93-D-3033 for work performed at Building LCH-4022, Marine Corps Base, Camp Lejeune, North Carolina. The report was prepared in conformance with J.A. Jones Environmental Services Company's quality assurance/quality control procedures to ensure that the report meets industry standards in terms of the methods used and the information presented. If you have any questions or comments concerning the report, please contact one of the individuals listed below.

Respectfully submitted,

J.A. JONES ENVIRONMENTAL SERVICES COMPANY



James X. Tan, L.G.
Senior Geologist

Tracy Thrift
Project Geologist

EXECUTIVE SUMMARY

Based on the analytical results from the soil excavation activities, groundwater monitoring well sampling events and the risk characterization evaluation, J.A. Jones Environmental Services Company (J.A. Jones) demonstrated that the Building LCH-4022 site can be classified as a low risk site according to the evaluation criteria provided in the North Carolina Department of Environment and Natural Resources (NCDENR), Underground Storage Tank Section's *Guidelines for Assessment and Corrective Action* dated July 1, 2001 (Guidance Document). Therefore, J.A. Jones recommends the Building LCH-4022 site be considered for No Further Action Status by the NCDENR.

J.A. Jones performed soil excavation activities on September 2, 1998, March 28, 2000, April 11, 2000, May 16, 2000, and May 25, 2000. A total of approximately 275.05 tons of contaminated soil was removed during the soil excavation activities. Review of the analytical results from soil samples collected on the excavation walls indicates that petroleum impacted soil was not detected at concentrations above the North Carolina Action Level of 10 milligrams per kilogram (mg/kg).

J.A. Jones completed installation of the replacement monitoring wells for LCH4022-1 and LCH4022-19 on May 2, 2000, which were abandoned during soil excavation activities conducted March 28, 2000. Replacement monitoring wells LCH4022-1R and LCH-402219R were gauged monthly and all on-site monitoring wells were gauged quarterly until LNAPL was not detected at a measurable thickness for four consecutive quarters.

On July 31, 2001, a groundwater monitoring well sampling event was conducted at each of the monitoring wells in the network. The groundwater samples were analyzed for volatile aromatic hydrocarbons and polynuclear aromatic hydrocarbons by United States Environmental Protection Agency (USEPA) Methods 602 and 610, respectively. The analytical results of this groundwater sampling event indicated that detected concentrations of dissolved hydrocarbon constituents have decreased to below the North Carolina Administrative Code Title 15A Subchapter 2L (15A NCAC 2L) *Classifications and Water Quality Standards Applicable to the Groundwaters of North Carolina.*

SECTION 1.0

INTRODUCTION

As a result of the remedial action of the petroleum contaminated soil and groundwater at the Building LCH-4022 site at the Marine Corps Base, Camp Lejeune, North Carolina, J.A. Jones Environmental Services Company has been retained by the Department of the Navy Atlantic Division, Naval Facilities Engineering Command (NAVFACENGCOM), to prepare this Annual Monitoring Report/Request for No Further Action Status. The purpose of this report is to present the findings associated with the remedial action of the impacted soil and groundwater, light non-aqueous phase liquid (LNAPL) recovery, and groundwater monitoring activities and to present the information necessary to demonstrate that the site is a candidate for No Further Action Status.

This Annual Monitoring Report/Request for No Further Action Status is organized into three sections of text including tables that present historical groundwater elevation survey and analytical data from soil and groundwater sampling events conducted at the site. Figures provided in this report present groundwater elevation contour maps detailing groundwater flow patterns and contaminated soil excavation and soil sample locations. Also included are appendices that present the laboratory analytical results from soil samples collected during soil excavation activities and groundwater monitoring well sampling events, a waste transportation and disposal log, and aggressive fluid-vapor recovery data.

Section I.0 Introduction includes the site history, an overview of the contaminated soil excavation, LNAPL recovery and groundwater monitoring activities.

Section 2.0 No Further Action Status Evaluation offers an evaluation of secondary contaminant sources, presence or absence of petroleum hydrocarbon product, unsaturated zone soil, and risk characterization that is required to obtain a status of No Further Action for the site.

Section 3.0 Conclusions and Recommendations addresses the conclusions and any recommendations from the contaminated soil excavation, LNAPL recovery, groundwater monitoring well sampling events, and No Further Action Status evaluation.

1.1 SITE HISTORY

The Building LCH-4022 is located at the Marine Corps Base, Camp Lejeune, North Carolina (N359,750, E2,498,560, based on map measurement). The Leaking Underground Storage Tank Corrective Action Plan (CAP), dated December 12, 1996, prepared by Richard Catlin & associates, Inc. (RC&A), indicates a presence of volatile aromatic hydrocarbons, polynuclear aromatic hydrocarbons (PAH), and heavy metals in

the area adjacent to the former heating oil underground storage tank (UST) basin. The 1,000-gallon, steel UST was removed from the site on June 28, 1992. On June 16, 1993, LNAPL was encountered in monitoring wells LCH4022-2 and LCH4022-3 at thicknesses of 1.19 feet and 7.95 feet, respectively. The horizontal and vertical extent of the petroleum impacted soil and groundwater were documented in the CAP prepared by RC&A. In addition, the CAP provides an evaluation of remedial action alternatives for the petroleum impacted soil and groundwater. **Figure 1-1** provides a site layout map of the former UST location.

A work plan, prepared by J.A. Jones, outlining the required remedial action activities, including excavation of the contaminated soil and natural attenuation of groundwater, was submitted to the Navy in February 1998. Soil excavation was performed at the site on September 2, 1998. However, due to the presence of LNAPL at a measurable thickness in monitoring wells LCH4022-1 and LCH4022-19, additional soil excavation activities were performed March 28, 2000, April 11, 2000, May 16, 2000, and May 25, 2000. Subsequent to the soil excavation activities and the abandonment of monitoring wells LCH4022-1 and LCH4022-19 conducted in March 2000, the monitoring wells were reinstalled in the same location and were gauged monthly for LNAPL occurrence. Quarterly groundwater elevation surveys were conducted from each of the monitoring wells in the network until LNAPL was not detected at a measurable thickness for four consecutive quarters.

1.2 PETROLEUM-IMPACTED SOIL EXCAVATION ACTIVITIES

J.A. Jones initiated soil excavation activities at the Building LCH-4022 site on September 2, 1998. The dimensions of the excavation were approximately 21 feet by 20 feet and a depth of approximately 3.5 feet below land surface (bls). Approximately 80.2 tons of contaminated soil was removed and transported to a North Carolina State Certified disposal facility in Autryville, NC. One composite soil sample was collected from each wall of the excavation. The locations of the four soil samples (SS-1 through SS-4) are illustrated in **Figure 1-2**. The soil samples were analyzed for total petroleum hydrocarbons (TPH) of diesel range organics (DRO) using USEPA Method 3550, for TPH of gasoline range organics (GRO) using USEPA Method 5030, and for TPH of oil & grease using USEPA Method 9071. The analytical results of the soil samples are summarized in **Table 1-1**.

Due to the presence of LNAPL in monitoring wells LCH4022-1 and LCH4022-19 after the soil excavation conducted September 2, 1998, additional soil excavation activities were conducted on March 28, 2000 in the vicinity of these two wells. The dimensions of the excavation were approximately 20 feet by 17 feet and a depth of approximately 6.5 feet bls. One composite soil sample (CS-01) was collected from eight locations on the excavation walls as illustrated in **Figure 1-3**. The sample was analyzed for TPH-DRO and TPH-GRO using USEPA Methods 3550 and 5030, respectively. During the March 28, 2000 soil excavation event, approximately 129.9 tons of contaminated soil were removed and transported to Oak Hill Farms, a North Carolina State Certified disposal

facility. Groundwater monitoring wells LCH4022-1 and LCH4022-19 were abandoned during the excavation activities on March 28, 2000.

The analytical result of soil sample CS-01 indicated the detected TPH-DRO concentration of 908 mg/kg, which is above the North Carolina Action Level of 10 mg/kg. Subsequently, on April 11, 2000, further excavation was conducted on the west side of the previous excavation conducted March 28, 2000. The dimensions of the excavation were approximately 17 feet by 12 feet and a depth of approximately 6.5 feet. The location of the additional excavation area is illustrated in **Figure 1-4**. Four composite soil samples (CSNW-01, CSEW-01, CSSW-01, and CSWW-01) were collected, each from six locations on each wall. The samples were analyzed for TPH-DRO and TPH-GRO using USEPA methods 3550 and 5030, respectively.

Replacement monitoring wells were installed in the same locations as abandoned monitoring wells LCH4022-1 and LCH-4022-19 on May 2, 2000. The new wells are identified as LCH4022-1R and LCH4022-19R, respectively.

Review of the analytical results of the soil samples collected April 11, 2000 indicated that TPH-DRO was detected in the soil sample collected from the south wall of the excavation (CSSW-01) at a concentration of 20 mg/kg, which is above the North Carolina Action Level of 10 mg/kg; therefore, the excavation was extended toward the south approximately 14 feet on May 16, 2000. During the May 16, 2000 soil excavation event, one composite soil sample (CSSW2-01) was collected from six locations along the south wall of the excavation and analyzed for TPH-DRO and TPH-GRO using USEPA methods 3550 and 5030, respectively. The analytical results of the composite soil sample collected May 16, 2000 indicated that TPH-DRO was detected in the soil sample at a concentration of 25 mg/kg, which is above the North Carolina Action Level of 10 mg/kg. Therefore, on May 25, 2000, the excavation was extended approximately 10 feet toward the south as illustrated in **Figure 1-5**. One composite soil sample (CSSW3-01) was collected from six locations along the south wall of the excavation and analyzed for TPH-DRO and TPH-GRO using USEPA Methods 3550 and 5030, respectively. The analytical results of the soil sample collected May 25, 2000 indicate that TPH-DRO was detected at a concentration of 10 mg/kg. Approximately 64.95 tons of excavated soil were removed and transported to Oak Hill Farms, a North Carolina State Certified disposal facility.

The analytical results of all confirmation soil samples are summarized in **Table 1-1** and a copy of the laboratory analytical reports with Chain Of Custody is included in **Appendix A**.

1.3 AGGRESSIVE FLUID-VAPOR RECOVERY

J.A. Jones conducted a groundwater elevation survey at the Building LCH-4022 site following the initial soil excavation event on September 2, 1998. The results of the survey indicated that LNAPL remained in monitoring wells LCH4022-1 and LCH4022-19 at a measurable thickness. Aggressive fluid-vapor recovery (AFVR) was performed at

these two monitoring wells from February 26, 1999 to August 23, 1999. In addition, AFVR was conducted at monitoring well LCH4022-2 from February 26, 1999 to April 8, 1999 and at monitoring well LCH4022-3 from February 26, 1999 to April 23, 1999. A total of 1,602 gallons of groundwater accumulated during the AFVR events were transported to the Building 976 North Plant treatment system for treatment. **Appendix B** presents a summary of the transportation and disposal of the soil and groundwater removed from the Building LCH-4022 site. **Appendix C** presents the results of each AFVR event conducted at the Building LCH-4022 site.

1.4 GROUNDWATER ELEVATION SURVEY

To evaluate the results of the soil excavation activities and gauge LNAPL occurrence at the site, J.A. Jones conducted groundwater elevation surveys on a monthly basis from groundwater monitoring wells LCH4022-1R and LCH4022-19R and on a quarterly basis from each of the monitoring wells in the network. **Table 1-2** presents a summary of the quarterly groundwater elevation measurements performed at the Building LCH-4022 site.

Review of the groundwater elevation survey data from May 18, 2000 to July 31, 2001 indicates that, after soil excavation was completed on May 25, 2000, LNAPL was only observed at wells LCH4022-1R and LCH4022-19R on June 27, 2000, with thicknesses of 0.01 feet and 0.01 feet, respectively.

Groundwater elevation contour maps (**Figures 1-6** through **1-9**) were created based on groundwater elevation data collected November 19, 1998, November 8, 1999, November 10, 2000, and July 31, 2001. As illustrated in **Figures 1-6** through **1-9**, the predominant groundwater flow direction is toward the west.

1.5 GROUNDWATER ANALYTICAL RESULTS

Groundwater monitoring well sampling events were conducted at each of the monitoring wells in the network on November 19, 1998 and July 31, 2001. The groundwater samples were analyzed for volatile aromatic hydrocarbons and polynuclear aromatic hydrocarbons using USEPA Methods 602 and 610, respectively.

The analytical results of the groundwater monitoring well sampling event conducted November 19, 1998 indicate that benzene, naphthalene, 1-methylnaphthalene, and 2-methylnaphthalene were detected in the groundwater samples collected from monitoring well LCH4022-19 at concentrations of 2 micrograms per liter (µg/L), 35 µg/L, 92 µg/L, and 48 µg/L, which are above the 15A NCAC 2L groundwater quality standard established for benzene, naphthalene, 1-methylnaphthalene, and 2-methylnaphthalene of 1 µg/L, 21 µg/L, laboratory quantitation limit, and 28 µg/L, respectively.

The analytical results of the groundwater monitoring well sampling event conducted July 31, 2001, indicate that volatile aromatic hydrocarbons were not detected above the laboratory quantitation limits. Phenanthrene was detected in the groundwater sample

collected from monitoring well LCH4022-18 at a concentration of 18 µg/L, which is below the 15A NCAC 2L groundwater quality standard established for phenanthrene of 210 µg/L. The laboratory analytical results of the groundwater samples are summarized in **Table 1-3**.

1.6 REPORTING REQUIREMENTS

As indicated in the CAP and as required in the NCAC, Title 15A, Subchapter 2L, Section 0.0106(h)(4), the submittal of this annual monitoring report is required to the NCDENR regional office in Wilmington, North Carolina.

J.A. Jones submits a monthly status report to the Navy that documents the progress of the remedial action at this site. In addition, the monthly status report includes groundwater monitoring well elevations, analytical data from sample collection events, and contaminant trend graphs that utilize the analytical results from groundwater samples.

Detected concentrations above the laboratory quantitation limit are indicated by shading.
NA indicates that the sample was not analyzed for the constituent.

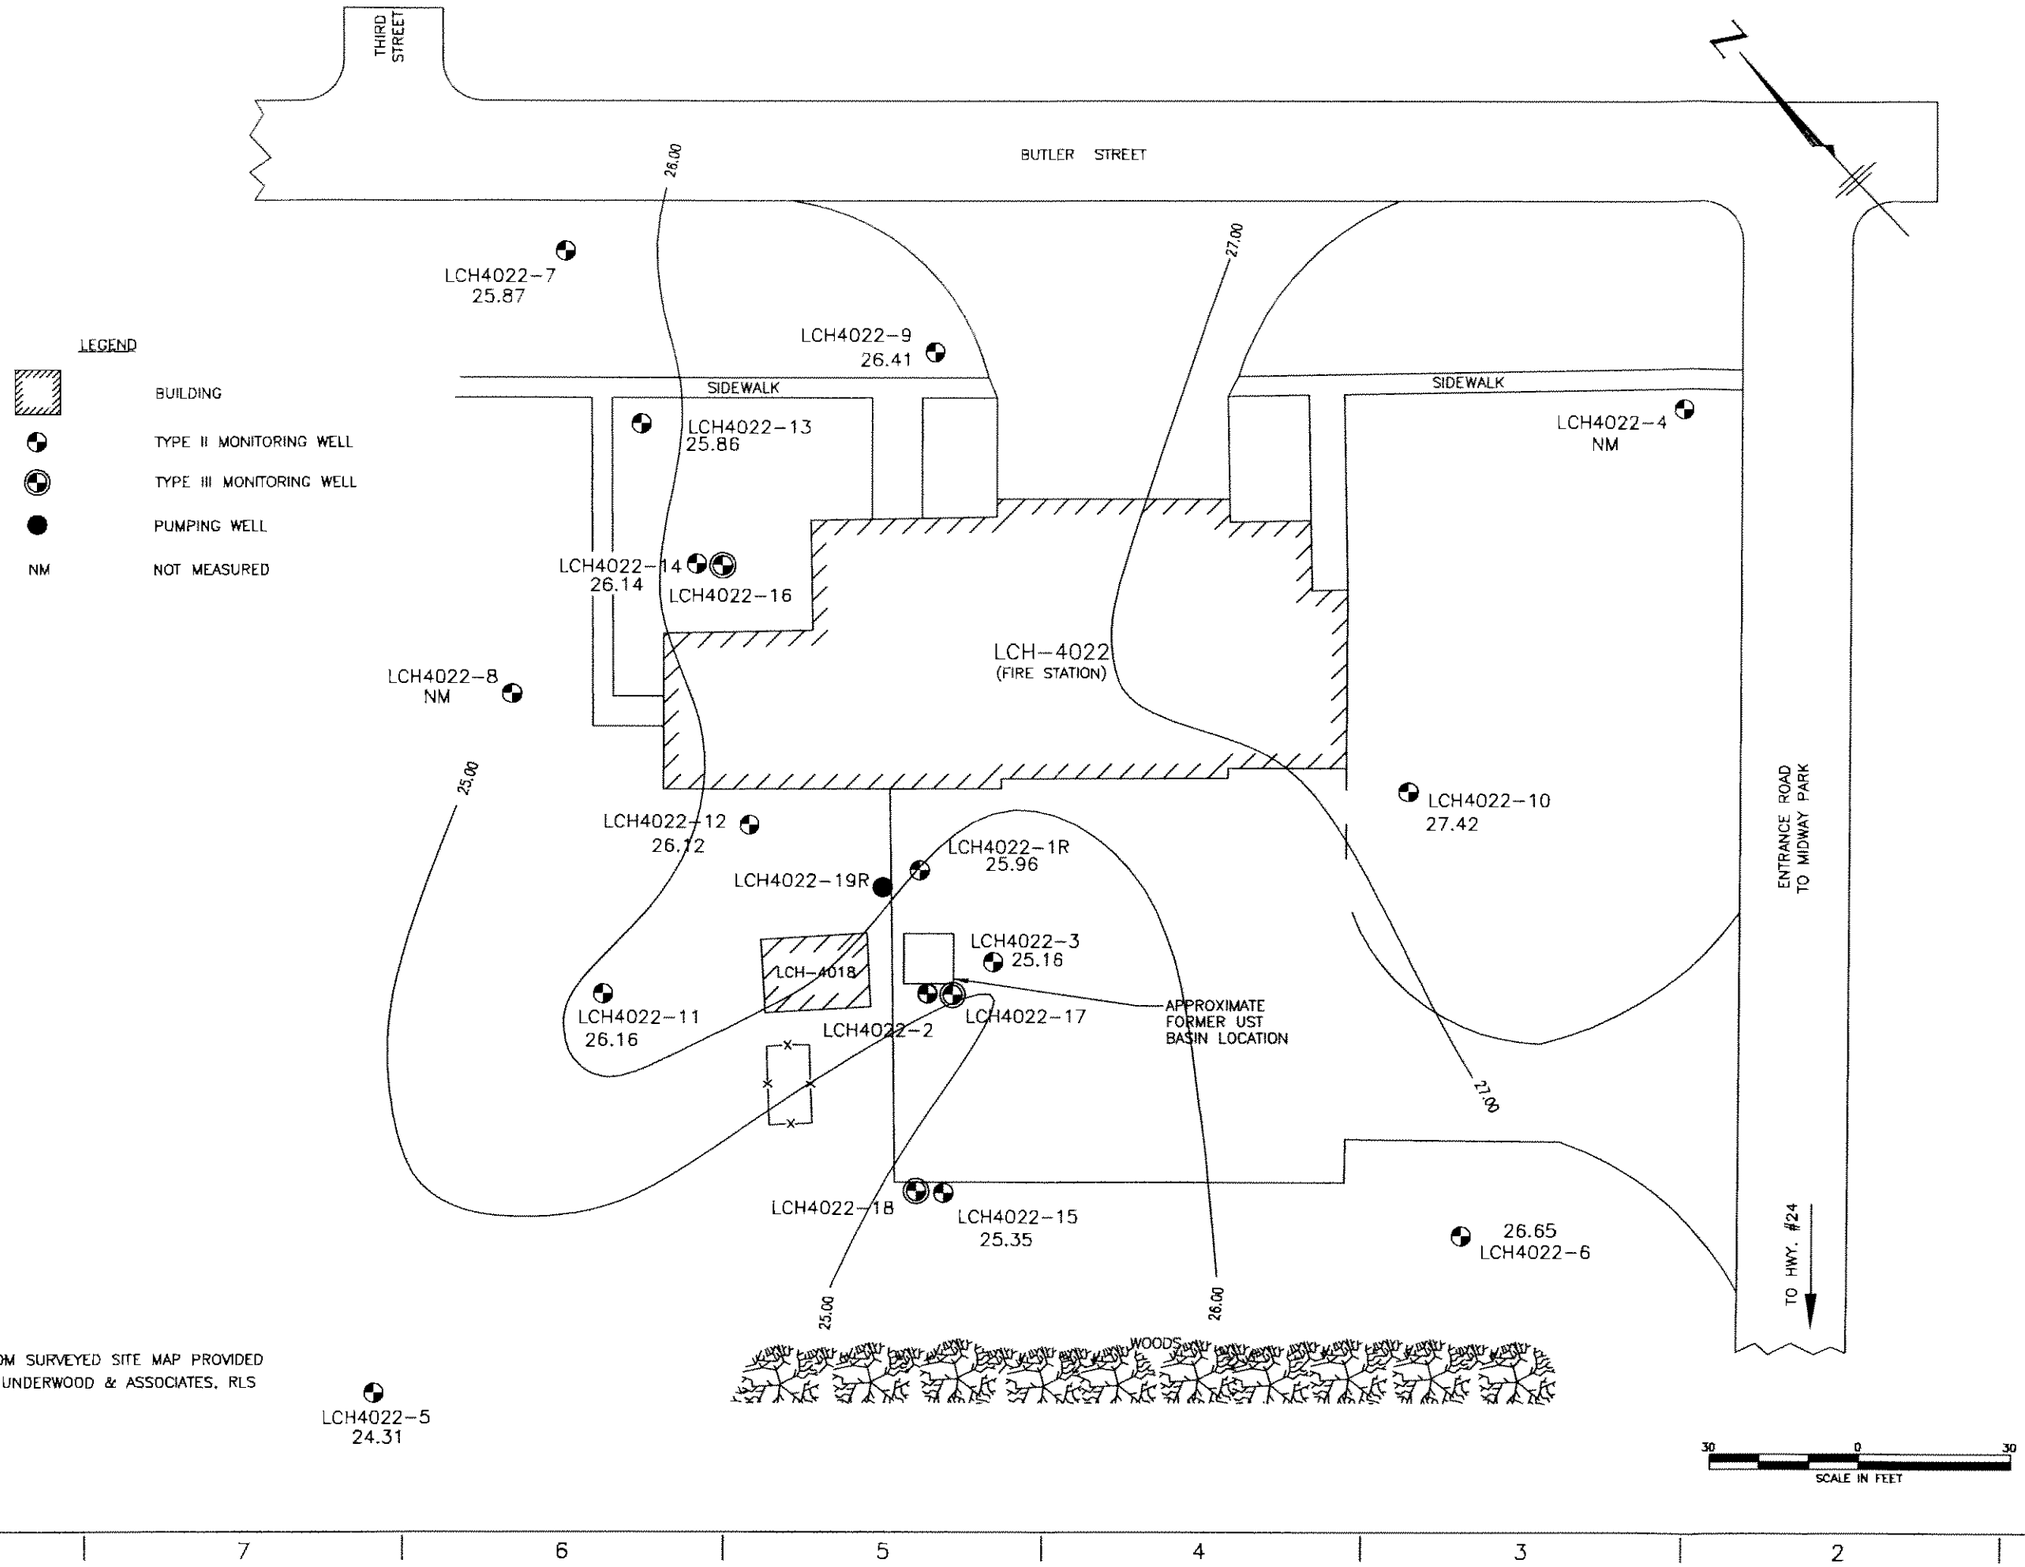
FIGURE 1-8



NOTES:

1. ADAPTED FROM SURVEYED SITE MAP PROVIDED BY MICHAEL UNDERWOOD & ASSOCIATES, RLS

SECTION 2.0

NO FURTHER ACTION STATUS EVALUATION

2.1 EVALUATION OF SECONDARY CONTAMINANT SOURCES

2.1.1 Petroleum Hydrocarbon Product

Liquid-phase petroleum hydrocarbon product has not been detected in any on-site groundwater monitoring well at the Building LCH-4022 site since June 27, 2000.

2.1.2 Unsaturated Zone Soil

As described in **Section 1.2 Petroleum-Impacted Soil Excavation Activities,** contaminated soil with detected TPH concentrations above the North Carolina Action Level of 10 mg/kg was excavated and transported to a State Certified disposal facility.

2.2 RISK CLASSIFICATION

This section summarizes the criteria used by the NCDENR to classify the site in a risk category. In accordance with the Guidance Document, the following details regarding the potential risk are required for classification as a high, intermediate, or low risk category. This site is currently ranked as a high risk, but the following information may enable the site to be reclassified to a low risk category, which will make the site eligible for consideration of a No Further Action status.

1. *Current Risk Status (High, Intermediate, or Low):*

   The NCDENR has the site classified as a High Risk site.

2. *Has an existing water supply well, including one for non-drinking purposes, been contaminated by the discharge or release?*

   According to the CAP, one water supply well is located hydraulically upgradient and approximately 1,600 feet from the Building LCH-4022 site. There is no evidence of this well being impacted by the petroleum product discharges from the former UST LCH-4022.

3. *Is a water supply well used for drinking water located within 1000 feet of the source area of a confirmed discharge or release?*

   According to the CAP, there are no municipal supply wells within 1,000 feet of the Building LCH-4022 site.

4. *Is a water supply well not used for drinking water located within 250 feet of the source area of a confirmed discharge or release?*

   According to the CAP, there are no water supply wells located within 250 feet of the Building LCH-4022 site.

5. *Does the groundwater within 500 feet of the source area of a confirmed discharge or release have the potential for future use in that there is no source of water supply other than the groundwater?*

   Because the Building LCH-4022 site is a fire station of a military housing area at the Marine Corps Base, Camp Lejeune, it is highly unlikely that this site will change its intended use.

6. *Do the vapors from the discharge or release pose a serious threat of explosion due to accumulation of the vapors in a confined space?*

   There is no documented presence of utility line vapors in the CAP. Underground utilities in the area of investigation include underground water lines, sewer lines, and storm drainage. All of these utilities are located within 100 feet of the former UST basin and are reportedly less than six feet deep. The groundwater table in the source area is approximately 3.5 feet to 8 feet bls. Utility depths intersect the water table, however, based on the analytical result from groundwater samples collected on July 31, 2001, no volatile aromatic hydrocarbons were detected at concentrations above the laboratory quantitation limit.

7. *Does the discharge or release pose an imminent danger to public health, public safety, or the environment?*

   All petroleum impacted soil with detected TPH concentrations above the North Carolina Action Level of 10 mg/kg were excavated and transported to a State Certified disposal facility. Detected concentrations of target compounds in groundwater monitoring well samples are below the State Regulatory Limit. Thus, the release is not expected to pose an imminent danger to public health, public safety, or the environment based on these means of exposure.

8. *Is surface water located within 500 feet of the source area of a confirmed discharge or release and does the maximum groundwater contamination concentration exceed the applicable surface water quality standard and criteria found in 15A NCAC 2B .0200 by a factor of 10?*

   There are no surface water bodies within 500 feet of the site. The nearest body of water is the New River and is located approximately 4,000 feet west of the site.

9. *In the Coastal Plain Physiographic Province as designated on a map entitled "Geology of North Carolina" published by the Department in 1985, is the source area of a confirmed discharge or release located in an area in which there is recharge to an unconfined or semi-confined deeper aquifer which the Department determined is being used or may be used as a source of drinking water?*

   Based on information provided by RC&A in the CAP, the site is located within the Coastal Plain Physiographic Province and is underlain by permeable sands, gravels, and limestone separated by confining units of less permeable sediments. The main aquifer utilized for water consumption in the Camp Lejeune area is the Castle Hayne aquifer.

   The CAP states that the surficial aquifer is comprised chiefly of sand, clay, sandy clay, and silt beds with occasional peat and shells. In the Camp Lejeune area, the surficial aquifer is approximately ten feet thick and is not the source utilized for water supply. The Castle Hayne aquifer and confining unit underlies the surficial aquifer and is used for water supply in the Camp Lejeune area. The confining unit is generally 10 feet thick and consists of partially eroded clay, silt, and sandy clay beds. The Castle Hayne aquifer is chiefly comprised of sand and limestone beds and is reported to be approximately 150 feet to 300 feet thick and averages approximately 203 feet thick in the Camp Lejeune area.

10. *Is the source area of a confirmed discharge or release located within a designated wellhead protection area, as defined in 42 USC 300j-7(e)?*

    Currently, there are no established wellhead protection areas in the Coastal Plain Region of North Carolina.

11. *Do the levels of groundwater contamination for any contaminant except ethylene dibromide, benzene, and alkane and aromatic carbon fraction classes exceed 50 percent of the solubility of the contaminant at 25 degrees Celsius or 1000 times the groundwater quality standard or interim standard established in 15A NCAC 2L .0202, whichever is lower (these levels have been termed as "gross contamination levels" – Table 7 of the Guidance Document)?*

Contaminant concentrations in the groundwater monitoring well samples collected at the Building LCH-4022 site do not exceed their corresponding gross contamination level. A list of the contaminants detected in groundwater samples collected from the Building LCH-4022 site with their maximum concentration, their final groundwater sampling concentration, and gross contamination levels are presented as follows:

List of Contaminants	Maximum Concentration from CAP (12/12/96) (µg/l)	Final Sampling Event (7/31/01) (µg/l)	NCDENR Gross Contamination Level (µg/l)
Ethylbenzene	55	BQL	29,000
Acenaphthene	200	BQL	2,120
Naphthalene	380	BQL	15,500
Phenanthrene	BQL	18	410

BQL indicates the constituent was below the laboratory quantitation limit

12. *Do the levels of groundwater contamination for ethylene dibromide or benzene exceed 1000 times the federal drinking water standard set out in 40 CFR 141 (these levels have been termed as "gross contamination levels" – Table 7 of the Guidance Document)?*

The maximum concentration of benzene detected at the Building LCH-4022 site does not exceed the gross contamination level. The maximum concentration of benzene detected in groundwater samples collected from the Building LCH-4022 site with its gross contamination level is presented as follows:

List of Contaminants	Maximum Concentration from CAP (12/12/96) (µg/l)	Final Sampling Event (7/31/01) (µg/l)	NCDENR Gross Contamination Level (µg/l)
Benzene	45	BQL	5,000

SECTION 3.0

CONCLUSIONS AND RECOMMENDATIONS

From September 2, 1998 to May 25, 2000, J.A. Jones implemented the selected remedial approach as outlined in the December 12, 1996 CAP prepared by RC&A. The selected remedial approach consisted of soil excavation and groundwater natural attenuation.

J.A. Jones conducted soil excavation activities on September 2, 1998, March 28, 2000, April 11, 2000, May 16, 2000 and May 25, 2000. Analytical results from the unsaturated zone soil samples collected by J.A. Jones during soil excavation activities indicate that petroleum impacted soils above the North Carolina Action Level were excavated and transported to an off-site State Certified disposal facility.

Groundwater samples were collected from each of the on-site monitoring wells on July 31, 2001, and analyzed for volatile aromatic and semi-volatile organic hydrocarbons by USEPA Methods 602 and 610, respectively. Concentrations of dissolved hydrocarbon constituents were below the 15A NCAC 2L groundwater quality standards.

As detailed in **Section 2.0 No Further Action Status Evaluation**, there is no documented presence of a petroleum hydrocarbon constituent in the closest water supply well. There is no documented presence of hydrocarbon vapors in underground utilities at the site and the petroleum-impacted groundwater located within the property boundaries is not located within a designated wellhead protection area, as defined in 42 USC 300h-7(e). The nearest surface water body is the New River which is approximately 4,000 feet west of the former UST basin.

No evidence or measurable thickness of LNAPL was identified in any of the on-site monitoring wells in four consecutive quarterly LNAPL gauging events. .

J.A. Jones, through its soil excavation, LNAPL gauging events, groundwater monitoring well sampling events, and risk characterization evaluation, has demonstrated that the Building LCH-4022 site can be classified as low risk. Further, it is recommended that the site be considered a candidate for No Further Action Status.

Date 09-18-98

Report Number: G182-191

Project ID: LCH-4022

Dear Mr. Hudson:

Enclosed are the results of the analytical services performed under the referenced project. Copies of this report and supporting data will be retained in our files for a period of five years in the event they are required for future reference. Any samples submitted to our laboratory will be retained for a maximum of thirty (30) days from date of this report unless other arrangements are requested.

If there are any questions about the report or the services performed during this project, please call for assistance. We will be happy to answer any questions or concerns which you may have.

Thank you for using Paradigm Analytical Labs for your analytical service projects. We look forward to working with you again on any additional needs which you may have.

Sincerely,

Paradigm Analytical Laboratories

Laboratory Director
Mark Randall

Thank you for using Paradigm Analytical Labs for your analytical services. We look forward to working with you again on any additional analytical needs which you may have.

Sincerely,

Paradigm Analytical Laboratories, Inc.

Laboratory Director
Mark Randall

Results for Total Petroleum Hydrocarbons
by GC 8015B

Client Sample ID:	UST LCH 4022-CSSW3-01	Date Collected:	5/25/00
Client Project ID:	LCH 4022	Date Received:	5/26/00
Lab Sample ID:	88464	Analyzed By:	BMS
Lab Project ID:	G182-516	%Solids:	86.4
Matrix:	Soil		

Compound	Result (MG/KG)	Quantitation Limit	Method	Dilution Factor	Date Analyzed
Gasoline Range Organics	BQL	6.9	5030/8015B	1.0	5/31/00
Diesel Range Organics	10	7.2	3550/8015B	1.0	5/30/00

Comments:

Quantitation Limits are fully calculated using dilution factors and % solids.
BQL = Undetected or below quantitation limit.

AFVR Event - August 23, 1999

AFVR Event - Vacuum Applied to Recovery and Monitoring Wells/Calculated Parameters	LCH4022-1 and LCH4022-19
Time Duration (hours)	1.25
Average Temperature (^{0}F)	106.5
Average Relative Humidity (%)	60.1
Average Velocity (ft/min)	695
Average FID Reading (ppm)	582
B_{WSW} (lb. water/lb. dry air)	0.0310
B_{WS} (water vapor % by volume)	0.0473
Stack Pipe Cross Sectional Area (ft^2)	0.087
T_S Stack Temperature (^{0}R)	566.5
Q_{std} (flow at DSCRM)	53.7
PPM_W (wet concentration=measured concentraction)	582
PPM_d (dry concentration)	611
PPM_c (PPM_v, volumetric concentration of VOC emissions as carbon, dry basis at STP)	611
C_{cm} (mg/dsm^3, mass concentration of VOC emissions as carbon)	305
C_c (lb/dscf, mass concentration of VOC emissions as carbon, dry basis, at STP)	0.000019
PMR_c (lb/hr, pollutant mass removal rate of VOCs as carbon)	0.06
$PMR_{Heating\ Oil}$ (lb/hr, pollutant mass removal rate of VOCs as Heating Oil)	0.07
$PMR_{Heating\ Oil}$ (lbs, total pollutant mass removal of VOCs as Heating Oil)	0.09
$PMR_{Heating\ Oil}$ (gals, total pollutant mass removal of VOCs as Heating Oil)	0.01
Total Gallons of Pollutant Volume Removal of VOCs as Heating Oil	**0.01**
Gallons of LNAPL Removed as Heating Oil from August 23, 1999 AFVR Event	**0**
Total Gallons of Pollutant Removed as Heating Oil from August 23, 1999 AFVR Event	**0.01**
Total Gallons of Pollutant Removed as Heating Oil Since Initiation of AFVR Activites February 26, 1999	**0.01**

APPENDIX D

GROUNDWATER MONITORING WELL SAMPLES – LABORATORY DATA

PARADIGM ANALYTICAL LABORATORIES, INC.
2627 Northchase Parkway S.E.
Wilmington, North Carolina 28405
(910) 350-1903
Fax (910) 350-1557

Mr. Casey Hudson
JA Jones Environmental Services
8936 Western Way, Suite 10
Jacksonville, Fl 32256

Date 12-08-98

Report Number: G182-231

Project ID: UST LCH 4022

Dear Mr. Hudson:

Enclosed are the results of the analytical services performed under the referenced project. Copies of this report and supporting data will be retained in our files for a period of five years in the event they are required for future reference. Any samples submitted to our laboratory will be retained for a maximum of thirty (30) days from date of this report unless other arrangements are requested.

If there are any questions about the report or the services performed during this project, please call for assistance. We will be happy to answer any questions or concerns which you may have.

Thank you for using Paradigm Analytical Labs for your analytical service projects. We look forward to working with you again on any additional needs which you may have.

Sincerely,

Paradigm Analytical Laboratories

Laboratory Director
Mark Randall

PARADIGM ANALYTICAL LABORATORIES, INC.

Results for Volatiles

by GC 602

Mr. Jeff Henninger
J.A. Jones Environmental Services
8936 Western Way, Suite 10
Jacksonville, Fl 32256

August 16, 2001

Report Number: G182-681

Client Project ID: LCH4022

Dear Mr. Henninger,

Enclosed are the results of the analytical services performed under the referenced project. Copies of this report and supporting data will be retained in our files for a period of five years in the event they are required for future reference. Any samples submitted to our laboratory will be retained for a maximum of thirty (30) days from the date of this report unless other arrangements are requested.

If there are any questions about the report or the services performed during this project, please call for assistance. We will be happy to answer any questions or concerns which you may have.

Thank you for using Paradigm Analytical Labs for your analytical services. We look forward to working with you again on any additional analytical needs which you may have.

Sincerely,

Paradigm Analytical Laboratories, Inc.

Laboratory Director
Mark Randall
