1.0 INTRODUCTION

This Contractor's Closeout Report describes drum removal and associated activities conducted in Operable Unit (OU) No. 2 at Marine Corps Base (MCB) Camp Lejeune, North Carolina. This closure report is prepared by OHM Remediation Services Corp. (OHM) in accordance with the OHM Revised Final Plans and Specifications dated March 31, 1995, Section 01010, Paragraph 1.3.1.10. It includes a description of the following activities:

- 1) Preparation of Preconstruction Submittals.
- 2) Mobilization and Site Setup
- 3) Trench Excavation, Drum Removal and Staging
- 4) Closure of Above Ground Storage Tanks (ASTs)
- 5) Sampling and Analysis of Excavated Materials
- 6) Waste Profiling
- 7) Transportation and Disposal of soil and Debris
- 8) Demobilization
- 9) Final Health and Safety Report
- 10) Summary of Record Documents

These activities were conducted under Naval Facilities Engineering Service Command (NFESC) Contract No. N47408-92-D-3042, Delivery Order No. 0032.

1.1 SITE BACKGROUND

Camp Lejeune is a training base for the U.S. Marine Corps. It is located in Onslow County, North Carolina. The nearest town is Jacksonville, North Carolina, located just north of the base. Camp Lejeune covers approximately 236 square miles, including 14 miles of coast line. It is bounded to the southeast by the Atlantic Ocean, to the northwest by State Route 24, and to the west by U.S. Route 17. The remedial action area, OU No. 2, is one of 13 operable units within Camp Lejeune. OU No. 2 is located approximately 2 miles east of the New River and 2 miles south of State Route 24. It is bordered to the north by Wallace Creek, to the west by Holcomb Boulevard, to the east by Piney Green Road, and to the south by Sneads Ferry Road. OU No. 2 covers an area of approximately 210 acres and includes three sites. From north to south these are Site 82, Site 6 and Site 9. Figure 1 in Appendix A shows the location of OU No. 2, sites 6 and 82.

Two main areas were excavated as part of the work described in this report. The first was located just south of the southwestern corner of Lot 203 in Site 6. It is referred to in this report as the Southern Trenches. Also associated with Site 6 were two additional trenches referred to as the Battery Trenches. Excavation of these trenches were not included in the

original scope of work for Site 6 but were added upon their discovery during the southern excavations. The other main area referred to as the northern trench was located in Site 82 just north of Site 6 boundary. Figure 2 shows the relative location of the trenches at Sites 6 and 82.

Site 6 had a history of various uses. From as early as the 1940s to the late 1980s the site was used for the storage and disposal waste and supplies. The northern portion of Site 6 was occupied by a fenced area designated as Open Storage Area Lot 203. Pesticides were reported to have been stored in a trailer on Lot 203. Former employees from Lot 203 reported disposal of various chemical including PCBs, cleaning solvents, electrolytes from used batteries, and waste oils. The use of Lot 203 and Site 6 as active storage areas had been discontinued prior to remediation.

Site 82, also known as the Piney Green Road volatile organic compound (VOC) Site, was predominantly covered by woodlands. Prior to remediation, it was randomly littered with debris including communication wire, spent ammunition casings, and drums. No controlled disposal operations were documented for the site, so the quantity of VOCs which may have been released and the location(s) of these releases are unknown.

Based on a review of historical aerial photographs, it appeared that the fenced boundaries of Lot 203 changed since it was in operation. As of 1994, the fenced portion of Lot 203 covered approximately 41 acres. The southern and northern trenches were located just outside the 1994 boundaries of Lot 203 at the southwestern and northern boundaries, respectively.

1.2 SUMMARY OF REMEDIAL INVESTIGATION

Camp Lejeune was placed on the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) National Priority List (NPL) that became effective on October 4, 1989 (54 Federal Register 41015, October 4, 1989). Region 4 of the United States Environmental Protection Agency (USEPA), the North Carolina Department of Environment, Health and Natural Resources (NC DEHNR) and the United States Department of the Navy (DoN) then entered into a Federal Facilities Agreement (FFA) for the base. The primary purpose of the FFA was twofold. First, it was to ensure that environmental impacts associated with past and present activities at Camp Lejeune were thoroughly investigated. Second, where necessary appropriate alternatives consistent with CERCLA and the Resource Conservation and Recovery Act (RCRA) Corrective Action would be developed and implemented to protect the public health and the environment.

Following a CERCLA Remedial Investigation (RI) of OU No. 2, DoN Atlantic Division, Naval Facilities Engineering Command contracted Baker Environmental, Inc. (Baker) to

develop a remedial design for removal of the drums and related activities. The remedial design efforts reflected the remedy which was selected and documented in the final Record of Decision (ROD) for the site. On August 11, 1993, Baker delivered its report entitled Final RAC Requirements Package Removal of Drums at Site 6, Marine Corps Base, Camp Lejeune, North Carolina to LANTDIV. The report described the selected remedy for Sites 6 and 82 for the Scope of Work described in this report.

The remedies included:

- Excavation of the buried drums and associated contaminated soil, staging of the drums, ASTs and miscellaneous debris and soil, characterization of the drum and AST contents where present, bulking of the drum and AST contents for disposal, decontamination of the drums, ASTs and debris, characterization of all material requiring disposal, and transportation and disposal of the drums, drum contents, miscellaneous debris, soil and water generated during site activities.
- OHM's scope of work as the remedial contractor included implementation of this remedial design.

1.3 SUMMARY OF ACTION

Upon receipt of the Notice-to-Proceed from LANTDIV, OHM commenced preparatory activities for the project such as plan preparation and review for all site activities. The work was categorized into definable phases for economical and efficient execution. Listed below are the major phases of the site work that was performed to fulfill the project specifications.

- Phase 1 – Preparation of preconstruction submittals (including a site visit to review existing conditions) and work plans.
- Phase 2 – Site preparation and mobilization; establish command center, decontamination facilities, staging areas, access, clearing and grubbing, and utility services.
- Phase 3 – Trench excavation; removal and staging of buried drums, miscellaneous debris and soil; collection of drums, ASTs and miscellaneous debris on the surface.
- Phase 4 – Confirmation sampling of the excavations and backfill of the excavations.
- Phase 5 – Characterization of the materials for disposal.

- Phase 6 – Decontamination of the drums, ASTs and miscellaneous debris as necessary for disposal; transportation and disposal of the drums, drum contents, ASTs, miscellaneous debris, soil, and process water.
- Phase 7 – Demolition of the staging area and disposal of the staging area debris; demobilization of all equipment and personnel from the site.

The following sections provide more detail on each phase of work.

2.0 PRECONSTRUCTION SUBMITTALS, MOBILIZATION AND SITE SETUP

2.1 PRECONSTRUCTION SUBMITTALS

Following the initial site visit in July, 1993 and receipt of project specifications in August, OHM submitted a Cost Proposal to perform work at Site 6 in late September, 1993. Upon receipt of Notice To Proceed, OHM prepared and submitted draft plans for Delivery Order No. 0032. These included a Work Plan, Health and Safety Plan, Contractors Quality Control (CQC) Addenda, a Field Sampling Plan, and Certification of Testing Laboratory Qualifications. The plans provided a description of the project objectives; schedule; sampling and analysis requirements; site work and excavation procedures; staging area construction requirements; decontamination procedures; and storage, transportation and disposal requirements which would be implemented to fulfill the requirements of the project specifications. A Status Log for all submittals is included in Section 9.

2.2 MOBILIZATION AND SITE PREPARATION

In January, 1994, OHM mobilized to the site to commence work. Activities included:

- The delivery of all equipment and personnel to the project site,
- Set up of the project trailer for the on-site command center,
- Construction and/or upgrading of access roadways,
- Construction of the staging areas, and
- All necessary measures for site drainage and erosion control.

OHM mobilized personnel and equipment to a command post at Storage Lot 203. Support equipment included an office trailer and decontamination trailer. Site security and work zones were established based on the Health and Safety Plan. Access roads were constructed for safe and easy vehicle access to the trench locations.

Prior to excavation of buried waste and debris from the trench areas, waste staging and decontamination areas were constructed as part of site setup. Two main areas were constructed to temporarily store excavated materials for segregation, identification, overpacking, decontamination and load out for transportation and disposal, one in Lot 203 near the southern trenches, and a smaller area near the northern excavation. The main area as shown on Figure 2 was located in Lot 203. A secondary area was established for temporarily staging soils and segregating debris at Site 82 during the northern trench excavation.

The main staging area approximately 150 x 100 was cleared and grubbed in Lot 203. Various cells were constructed including a soil staging cell, debris staging cell, temporary rinse area, processing area, and a decontamination pad. A synthetic liner was placed on the ground to prevent cross contamination of underlying soils. A perimeter ditch was dug around the staging area to anchor the liner. The ditch was subsequently filled with clean soils and the area bermed with an 18-inch high berm for secondary containment. Project photographs in Appendix B show the construction of the lined processing and staging areas. A second stockpile area was utilized near the northern excavation. It was also lined and covered with visqueen.

In addition to the soil staging area, a lined decontamination facility and drum staging area were constructed. The drum storage area was used to hold overpack drums containing waste and hazardous debris awaiting characterization or disposal. The decon pad was used as a wash down area for equipment and to triple rinse metallic debris, drum carcasses, and other non-hazardous inorganic debris which was subsequently managed as solid waste. Additionally, a 12,000 gallon holding pool was erected and utilized for collecting decontamination rinse waters prior to analysis, transportation and disposal.

3.0 EXCAVATION, SEGREGATION, AND STAGING OF BURIED WASTES

Excavation of buried wastes began on January 26, 1994. Excavations took place in three areas, which were referred to as the Southern Excavation, the Northern Excavation, and the Battery Area. Each area was staked by Baker according to the anticipated limits of excavation per the RAC Requirements Package. Figure 2 in Appendix A indicates the locations of the excavations.

3.1 EXCAVATIONS

The Southern Area trenches of Site 6 were the first location where excavations occurred. Two trenches were excavated with a tracked excavator. These were referred to as the east and west excavations. Materials encountered included drums, small containers (5 gallons or less), batteries, shell casings, communications wire, wood, and miscellaneous debris. These were removed along with any soil which had visual evidence of contamination and initially staged adjacent to the excavations. The materials and soil were inspected for evidence of contamination and monitored using a photoionization detector (PID) to distinguish potentially hazardous from non hazardous soils. The materials and soil were further segregated based on the concentration of organic vapors detected. The small containers were placed in overpack drums. Subsequently, all hazardous materials were transported to the staging area in Lot 203. Nonhazardous debris, including communication wire, wood, and casings were stockpiled adjacent to the excavations.

A total of 678 cubic yards of soil and debris were excavated from the east excavation, and a total of 252 cubic yards were excavated from the west excavation. Soil samples from the sides and base of the excavations were collected and field screened to confirm that all contaminated soil had been removed. Once PID readings were below the action limit of 5 ppm, final confirmation samples were collected and shipped to an off site laboratory for analysis.

The excavation of the Northern Area in Site 82 began on February 8, 1994. One continuous trench was excavated. Over 1,300 cubic yards of material were excavated from the Northern Area trench.

Similar materials such as drums, inorganic debris and communication wire were encountered and procedures for testing were implemented as in the Southern Area with two exceptions. The soil in the area adjacent to the northern trench was contaminated by chlorinated hydrocarbons. This trench was located in Area of Concern (AOC) 1 which was scheduled to be remediated by in-situ soil vapor extraction as part of a future delivery

order. OHM performed soil remediation of AOC-1 Area A under RAC Contract N62470-93-D-3032, Delivery Order 15 utilizing soil vapor extraction methods. A draft final report was issued in September 1996. Therefore, the walls and bottom of the Northern Area trench were not sampled for confirmation testing. Second, the northern trench contained numerous 2-gallon containers of what appeared to be heavy grease or petroleum product which was not observed in the southern trenches.

The Battery Area was the final area to be remediated. Two trenches were excavated beginning in February, 1994. These were referred to as the east and west trenches. The two parallel trenches were excavated to approximately 10 feet wide, 5 feet deep, and 105 to 125 feet in length. Approximately 425 cubic yards of material was removed, of which batteries comprised one-third of the total. Several truckloads of batteries were removed totalling over 100 tons.

3.2 WASTE SEGREGATION AND STAGING

As the trenches were excavated, inorganic non-hazardous debris including communication wire, scrap metal, or other materials were visually inspected, sifted through and physically segregated by the operator at the time of excavation. Soil was separated from debris with the use of a custom designed air bucket. Empty 55-gallon drums, empty 5-gallon pails, or other containers which previously may have contained hazardous materials were taken to the decon pad for triple rinsing. Pressure washing was performed using a low volume, moderate pressure portable sprayer to clean the debris. Following triple rinsing, the containers were crushed and subsequently managed at the DRMO as scrap metal. With the exception of a large number of 2-gallon grease containers found in the northern excavation, metal containers, glass vials, porcelain jugs etc. containing unknown chemicals, greases, oils, and other potentially hazardous materials were screened for compatibility, overpacked into steel drums, marked, and transported to the Lot 203 staging area for characterization and subsequent disposal. The 2-gallon grease containers were bulked in two 20-cubic yard roll off containers. Soils were screened and segregated based on readings with a hand held photoionization detector (PID) noting the presence or absence of volatile contaminants. Nonhazardous debris was temporarily stockpiled adjacent to each respective excavation.

4.0 ABOVEGROUND STORAGE TANKS CLOSURE

The scope of services for the five aboveground storage tanks located near the railroad tracks included emptying, rinsing, cutting, and managing the ASTs as scrap metal. Pumpable product if present, was removed from each of the 250-gallon capacity tanks by Noble Oil using a vacuum truck. Approximately 740 gallons of diesel product and water was managed off-site in Sanford, North Carolina, as a recyclable material. Following the removal of pumpable product, the atmosphere inside each of the tanks was tested for the presence of flammable vapors and oxygen content. Before any of the tanks could be moved or dismantled, the tank's atmosphere was checked to ensure that potentially flammable vapors were below 10% of the lower explosion limit or less than 8% oxygen. No carbon dioxide or nitrogen was necessary to inert the tanks.

After the tanks were determined to be safe, the tanks were relocated to the lined decontamination area. The tanks were cut apart using hand held hydraulic nibblers into manageable pieces. They were then pressure washed and decontaminated of any remaining residues and loaded onto dump trailers for transportation to the DRMO for subsequent management as scrap steel. Rinsate from the tank decontamination was collected and temporarily stored in the above-ground 12,000-gallon holding pool on-site. Sampling and analysis activities are provided in Section 5.0.

5.0 SAMPLING AND ANALYSIS

5.1 SUMMARY OF SAMPLING ACTIVITIES

Analytical testing was performed for a variety of purposes during the course of the project. First, confirmation samples of soil from excavations were collected and analyzed to determine if all soils requiring remediation had been removed. Second, bulk samples from the combined contents of more than one drum were tested for compatibility. Third, waste characterization samples were taken from soil, drum contents, miscellaneous debris and water to determine the appropriate methods of disposal. Finally, various QA samples were collected to ensure that sufficient quality control had been attained. All samples reported in Tables 5.2 through 5.7 were analyzed off-site by Analytical Services Corp. (ASC) in Findlay, Ohio or IT Corp. Analytical Services in Knoxville, Tennessee, CKY Inc., or Ceimic Corp.

Because the analytical results often determined the course of the remaining work, a summary of the sampling categories and nomenclature is presented in Table 5.1. Details of the type and purpose of each type of sample are presented in the following sections. With few exceptions, the sample identification system was applied uniformly. Tables 5.2 and 5.3 were developed to provide a comprehensive summary of all samples, sample ID numbers, analysis performed, sample dates, and locations for the various sampling events conducted throughout the project.

Table 5.1 – Sampling Categories

<i>Sample ID Class</i>	<i>Type of Sample</i>	<i>Purpose of Sampling</i>	<i>Number of Samples</i>	<i>Dates of Sampling</i>
CLJ-CSS	Soil from excavation walls and floors	Confirmation that excavations are complete	51	2/4/94-3/3/94
CLJ-DWS	Solids from drums	Compatibility for bulking and disposal requirements	45	2/24/94-11/9/94
CLJ-DWW	Decon water	Disposal requirements	4	2/24/94-1/25/95
CLJ-DFE	Fire extinguisher drum	Disposal requirements	1	3/3/94
CLJ-DG	Composite of grease waste stream	Disposal requirements	1	2/24/94
CLJ-DP	Composite of used PPE	Disposal requirements	2	2/25/94
CLJ-DS	Soil from stockpiles and some drum samples	Disposal requirements	21	2/4/94-3/4/94
CLJ-DB	Battery pile composite	Disposal requirements	1	2/25/94
CLJ-DD	Composite of communication wire	Disposal requirements	1	12/18/94

Table 5.1 – Sampling Categories

<i>Sample ID Class</i>	<i>Type of Sample</i>	<i>Purpose of Sampling</i>	<i>Number of Samples</i>	<i>Dates of Sampling</i>
CLJ-WCS	Soils from trenches and stockpiles for pesticides	Disposal requirements	10	8/24/94-8/26/94
C6527-6529	Composites of various CLJ-DS samples	Disposal requirements	3	2/22/94
C6617-6627	Bulked samples of various drums	Disposal requirements	6	6/24/94

5.2 CONFIRMATION SAMPLES FROM EXCAVATIONS

During the removal of the buried drums and miscellaneous debris, soil which was stained or had other indications of contamination was also excavated. Vertical excavation ceased when the water table was encountered. Lateral excavation continued until field results indicated volatile organic compounds were absent or present only in negligible concentrations.

Field testing was performed as follows. The soil samples were collected on approximately 25 foot centers. An excavator bucket was used to obtain a bulk sample from the appropriate locations. The sample was initially tested with a photoionization detector (PID). If the PID reading was greater than 5 parts per million (ppm), the excavation would be extended an additional 2 feet into the tested surface. If the sample registered less than 5 ppm on the PID, headspace analysis would be performed. If the headspace analysis indicated less than 5 ppm, further excavation was stopped. Figure 3 in Appendix A indicates the approximate locations of the sampling points.

To ensure that all contaminated soil was removed, once these field observable limits were reached soil confirmation samples were collected from the walls and bottoms of the excavations using the same procedures. These samples were given an alphanumeric code which began with the prefix CLJ-CSS, followed by a unique 3 digit identifying number. Samples were sent off-site to Analytical Services Corporation laboratory in Findlay, Ohio or IT Corp. and analyzed for the parameters specified in the approved Sampling and Analysis Plan (SAP). The sample identification numbers, dates the samples were collected, and locations of collection are shown in the summary Table 5.3. Specific analytical results for these confirmation samples are shown in Table 5.4. Duplicate confirmation sample results are presented in Table 5.5. Copies of original analytical results are in Appendix I and copies of the Chains-of-Custody are in Appendix G. The amended SAP called for confirmation samples to be analyzed in accordance with NEESA Level C protocols. All other samples were subject to NEESA Level E reporting requirements. Laboratory quality control data can be found attached to the individual analytical reports included in

Appendix I. The data is provided along with the analytical reports in chronological order for reference.

5.3 CHARACTERIZATION SAMPLING AND ANALYSIS

Characterization sampling served two purposes. First, it identified the physical properties of the different media and the contaminants present in each so the appropriate method of disposal could be determined for each. Second, where large numbers of items having small quantities were involved (such as containers with volumes of less than 5 gallons) it identified potential incompatibility of waste types and determined which could safely be bulked together for more efficient handling and disposal. Table 5.2 provides a comprehensive summary of samples obtained and analyzed for Sites 6 and 82 trenches. The sample identification numbers, parameters, dates the samples were collected, and locations are shown. A summary of analytical results for each individual sample is shown in Table 5.6. Copies of original analytical results are in Appendix I and copies of the Chains-of-Custody are in Appendix G. Copies of the QC analytical data are also in Appendix I.

5.4 DRUM CHARACTERIZATION

A number of the drums which were excavated contained solid wastes while a few contained liquids. In order to identify these contents for disposal and ensure compatibility during bulking, samples were collected and analyzed in accordance with the SAP. The majority of the solid samples were given an alphanumeric code which began with the prefix CLJ-DWS, followed by a unique 3 digit identifying number. (Six drum samples collected on March 4, 1994 were mislabeled with the prefix CLJ-DS).

A total of 51 drum solids samples were analyzed. The majority of these samples (39) were collected on February 24, 1994. Six more were collected on March 4, 1994, 3 were collected on May 5, 1994, and 3 on November 9, 1994. In addition, 6 composite samples from multiple drums were collected on February 25, 1994, and a seventh composite sample was collected on July 18, 1994. The composite samples have identifying numbers beginning with the prefix C. Tables 5.2 and 5.6 include a summary of these samples and specific analytical results. Copies of the analytical data and chain-of-custodies are provided in Appendices G and I.

5.5 SOIL CHARACTERIZATION

The stockpiles of excavated soils were initially sampled during the trenching and removal of subsurface debris. These samples have the common alphanumeric prefix CLJ-DS. A total of 15 samples were collected: 3 on February 4, 1994; 9 on February 17, 1994, and 3 on

March 3, 1994. To date, copies of the analytical reports for the 3 samples collected on February 4 have not been located. In addition, 3 composite samples of soil were collected on February 17, 1994.

The samples were analyzed for a broad range of chemical contaminants. Both total constituent and TCLP analyses were performed using EPA Methods for conventional parameters, petroleum hydrocarbons, pesticides, PCBs, volatile and semi-volatile organics and heavy metals per the approved Sampling and Analysis Plan (SAP).

Following the discovery of chlorinated pesticides in some of the soils, additional samples were collected specifically for pesticide analysis. These have the common prefix CLJ-WCS. Ten of these samples were collected; 2 on August 24, 1994 and 8 on August 26, 1994. These sampling activities were conducted following amendment of the SAP. Soil characterization results can be found in Table 5.6. Complete laboratory analytical reports and chain-of-custodices are provided in Appendices G and I.

5.6 MISCELLANEOUS SAMPLES

Battery Pile

On February 25, 1994, one sample was collected which was labeled Battery Pile Disposal Composite and had the prefix CLJ-DB. It was analyzed for a broad spectrum of contaminants by TCLP.

Grease Waste Stream

On February 25, 1994, a composite sample was collected from the grease wastestream obtained from the northern excavation. It was identified with the prefix CLJ-DG. It was analyzed for total concentrations of a broad range of contaminants.

PPE Disposal

On February 25, 1994, 2 composite samples of used PPE were collected for analysis. They were identified with the prefix CLJ-DP. They were analyzed by TCLP for a broad range of contaminants.

Decon Rinse Water

During the site operations, significant volumes of rinsate were collected from decontamination of tanks, debris, and equipment. This rinsate was collected in the 12,000-gallon temporary pool near the staging area. As the pool became full, a composite sample was collected and analyzed to ascertain if the water could be disposed at the Camp Lejeune Publicly Owned (Wastewater) Treatment Plant (POTW). These samples were identified with the common prefix CLJ-DWW. A total of 4 samples were collected,

one each on February 24, 1994, March 1, 1994, March 15, 1994, and January 25, 1995. Wastewater samples and results are summarized in Table 5.7.

Fire Extinguisher Drum

On March 3, 1994, a sample was collected from drum number 148, which was referred to as the fire extinguisher drum. It was analyzed for a broad spectrum of contaminants. This sample was also part of the composite analyzed as C6622.

Communications Wire

On December 8, 1994, a sample of communications wire (considered nonhazardous debris) from the Northern and Southern trenches was collected. The sample identifier had the prefix CLJ-DD. This sample was subjected to analysis for a broad range of contaminants, both for total constituent analysis and TCLP.

NOTE :

C (Concentration) Qualifiers :

- B Reported Value was obtained from a reading that was less than the Contract Required Detection Limit, but greater than or equal to the Instrument Detection Limit
- U Analyte was analyzed for but not detected

Q Qualifiers :

- E Reported Value is estimated because of the presence of interference
- M Duplicate injection precision not met
- N Spiked sample recovery not within control limits
- S Required value was determined by the Method of Standard Additions (MSA)
- W Post-digestion spike for Furnace AA analysis is out of control limits (85-115%), while sample absorbance is less than 50% of spike absorbance
- * Duplicate analysis not within control limits
- + Correlation coefficient for the MSA is less than 0.995

M (Method) Qualifiers :

- P ICP
- A Flame AA
- F Furnace AA
- PM ICP when Microwave Digestion is used
- AM Flame AA when Microwave Digestion is used
- FM Furnace AA when Microwave Digestion is used
- CV Manual Cold Vapor AA
- AV Automated Cold Vapor AA
- CA Midi-Distillation Spectrophotometric
- AS Semi-Automated Spectrophotometric
- C Manual Spectrophotometric
- T Titrimetric
- NR Analyte not required to be analyzed

6.0 SITE RESTORATION AND WASTE MANAGEMENT

6.1 BACKFILL

In March, 1994, backfilling operations began for the northern, southern, and battery area trenches. Analytical reports from the confirmation sampling indicated that all hazardous materials and soils had been removed from the southern trenches. As discussed earlier, no confirmation sampling was performed in the northern excavation due its location in AOC-1 which was scheduled for future remediation. As directed by Base personnel, the non-hazardous debris which has been removed from the Southern and Battery Trenches was placed back into their respective excavations during the backfill operations. The remaining void space of the southern and battery trenches was filled with soils from the Base borrow area. Compaction was performed by conducting several passes of the earth moving equipment over the fill. No analytical or geotechnical testing was performed. The northern excavation at Site 82 was regraded and filled with adjacent soils.

Subsequent to the initial backfilling operation in March, guidance regarding the return of debris to the excavation was modified by Base personnel. The debris which was returned to the excavations was required to be removed and placed into the Base landfill as nonhazardous debris. This activity was subsequently performed by OHM during OHM's second mobilization to the site.

6.2 TRANSPORTATION AND DISPOSAL

Waste material was disposed at Camp Lejeune facilities, recycled or disposed of at off-site facilities. All material was appropriately characterized and profiled prior to final disposition.

Material managed at Camp Lejeune included empty drums which were triple rinsed, scrap ASTs, and decon water. After being crushed, the drums were sent to the Camp Lejeune Defense Reutilization Management Office (DRMO) for recycling or disposal. As discussed in Section 4.0, the contents of the five (5) 250-gallon AST's were removed. The AST's were cut up, decontaminated, and shipped to the DRMO. The rinse and decontamination water was collected in a 12,000-gallon pool and tested. Following receipt of analytical results, the water was shipped to the Camp Lejeune Wastewater Treatment Plant (POTW) for treatment and disposal. A summary of the materials disposed on-site, their destination and quantity are provided in Table 6.1, entitled Summary of On-Site Recycle, Treatment, or Disposal.

Table 6.1 Summary of On-Site Recycle, Treatment, or Disposal

<i>Description</i>	<i>Quantity</i>	<i>Destination</i>	<i>Purpose</i>	<i>RCRA Classification</i>
Rinse and Decon Water from AST's	12,000 gallons	Base Wastewater Treatment Plant	Treatment and Disposal	Nonhazardous
Triple Rinsed Drums and Containers	N/A	DRMO	Recycle/Disposal	Nonhazardous
AST Carcasses	5 X 250-gallon cap. each	DRMO	Recycle/Disposal	Nonhazardous

Material disposed off-site included both RCRA hazardous and nonhazardous solid waste. Included were petroleum contaminated soils, pesticide contaminated wastes, batteries, battery debris, grease cans, wire, hazardous liquids and solids of various types, and a mixture of kerosene, motor oil, diesel fuel and water. Table 6.2 presents an inventory of the materials sent for off-site recycle or disposal. All waste material that was shipped to off-site facilities was transported by licensed haulers. All trucks were weighed at the Camp Lejeune truck scales in Lot 203 to establish their tare, or empty, weight prior to being loaded.

After loading, the trucks were reweighed to establish their gross (or full) weight and to calculate the net (or payload) weight. The trucks were brushed to remove soils and debris from the tires and undercarriage, the manifests were signed by Camp Lejeune personnel, and the truck(s) were released for travel to the recycle or disposal facility indicated on the manifest. Copies of the Facility-Signed Waste Manifests are included in Appendix C. Copies of the Certificates of Disposal or Recycle are included in Appendix D.

In March 1994, over 330 tons of petroleum contaminated soil removed from the trenches was transported and recycled by American Soils Corporation in New Bern, North Carolina. Subsequent to these shipments, OHM discovered the presence of pesticides including DDT in some of the excavated 55-gallon drums based on disposal characterization analyses. Based on these findings, an amendment to the SAP was implemented to perform additional sampling and analysis of excavated soils to include pesticides and PCBs. At that time, an additional estimated 400 cubic yards of petroleum contaminated soil was stockpiled in Lot 203 awaiting off-site disposal. These analyses revealed total concentrations of pesticides exceeding the permit limits of American Soils Corporation. OHM in consultation with LANL/DIV determined that although this soil was not RCRA hazardous (by characteristic), these soils (400 cy) should not be disposed at the American Soils facility. The soils remained covered and stored on-site. It was later determined that these soils would be treated on-site in the biocell to be constructed in Lot 203 in 1995. The biocell would be designed and permitted to specifically treat petroleum contaminated soils.

Table 6.2 - Summary of Off-Site Waste Recycle or Disposal

<i>Date</i>	<i>Description</i>	<i>Total Quantity</i>	<i>Destination</i>	<i>Manifest Number</i>	<i>RCRA Classification</i>
2/16/94	Mixture of Kerosene, Motor Oil, Diesel Fuel, and Water	740 gallons	Nobel Oil, Sanford, SC	24056	Nonhazardous
3/24/94	Petroleum Contaminated Soil from Lot 203	332.10 tons in 18 loads	American Soils Corporation, New Bern, NC	001 to 018	Nonhazardous
12/20/94	Battery Debris	109.48 tons	Piedmont Landfill, Kernersville, NC	31542, 31502-31505, 33132	Nonhazardous
12/20/94	Grease Cans in Cubic Yard Boxes	20 cubic yard boxes, 9.25 tons	Laidlaw Landfill, Pinewood, SC	99901	Nonhazardous
1/9/95	Grease Cans in Cubic Yard Boxes	15 cubic yard boxes, 8.66 tons	Laidlaw Landfill, Pinewood SC	9902	Nonhazardous
1/9/95	Grease in Drums	2 drums, 1.16 tons	Laidlaw Landfill, Pinewood, SC	99902	Nonhazardous
2/28/95	Calcium Hypochlorite with Chloroform, and/or DDT	8 drums, 0.97 tons	CWM Resource Management Inc., Morrow, GA	I1021	Hazardous Waste
2/28/95	Hazardous Waste Liquid with Lead and/or DDT	8 drums, 0.375 tons	CWM Resource Management Inc., Morrow, GA	I1021	Hazardous Waste
2/28/95	Hazardous Waste Solid with DDT and/or Lead	32 drums, 4.97 tons	CWM Resource Management Inc., Morrow, GA	I1021	Hazardous Waste
2/28/95	Waste Corrosive Solid	2 drums, 0.15 tons	CWM Resource Management Inc., Morrow, GA	I1021	Hazardous Waste
2/28/95	Waste Oils and Greases	3 drums, 0.0805 tons	CWM Resource Management Inc., Morrow, GA	I1021	Nonhazardous
2/28/95	Waste 16-6-B06-DOT	12 drums, 1.135 tons	CWM Resource Management Inc., Morrow, GA	I1021	Nonhazardous
3/2/95	Wire and Battery Debris	73.88 tons in 4 loads	Piedmont Landfill, Kernersville, NC	93-D-3032-0015-0026, -0027, -0028, -0029	Nonhazardous
3/3/95	Wire and Battery Debris	81.04 tons in 4 loads	Piedmont Landfill, Kernersville, NC	93-D-3032-0015--0030, -0031, -0032, -0033	Nonhazardous

6.3 DECOMMISSIONING AND DEMOBILIZATION

Upon completion of the field activities, disturbed areas were backfilled with soil from the Base borrow pit as necessary, graded, and seeded to restore them to pre-excavation conditions. The northern excavation was regraded using adjacent soils since further remediation work was planned in this area under a separate Delivery Order. Following transportation and disposal of waste materials, the 12,000-gallon pools, drum staging area and other lined areas were decommissioned and decontaminated. Berm materials, including the synthetic liners were managed off-site as non-hazardous solid waste. Support facilities including the command trailer and decontamination trailer remained on-site to be available for other active Delivery Orders.

As discussed in Section 6.2, approximately 400 cubic yards of soil was left on-site in a covered and contained cell in Lot 203. This petroleum-contaminated soil was subsequently placed into and managed in the newly constructed biocell in 1996, which is adjacent to the groundwater treatment plant at Site 82. A draft report detailing the construction operation and maintenance of this biocell under Delivery Order 15 of RAC Contract N62470-93-D-3032 was issued in November 1996.

7.0 FIELD CHANGES AND CONTRACT MODIFICATIONS

7.1 FIELD CHANGES

Several field changes were instituted during the site work:

- Rather than transporting the excavated drums, soil and material directly to the main staging area, initial staging took place on bermed and lined area adjacent to the excavations. Initial field characterization was performed using a photoionization detector (PID). Small containers (less than 5 gallons) were overpacked before transportation to the main staging area.
- Rather than determine the limits of excavation based on visual staining of the soil, PID readings were taken. If the PID registered more than 5 parts per million (ppm), an additional 2 feet of soil was excavated laterally. If the PID registered less than 5 ppm, headspace analysis was performed. If the PID reading from the headspace analysis was greater than 5 ppm, an additional 2 feet of soil was excavated laterally. If the reading from the headspace analysis was less than 5 ppm, then a confirmation sample was collected and sent to the off-site laboratory for analysis.
- As directed by Base personnel, the nonhazardous debris associated with the trenches was replaced back into the excavations during the backfill operations which began in March, 1994. The original SOW included off-site disposal for these materials.
- The Sampling and Analytical Plan was amended to require NEESA Level C reporting requirements for confirmation samples only. All other samples were subject to NEESA Level E requirements.
- As redirected by Base personnel, the non-hazardous debris was re-excavated and routed to the Base landfill in April 1994.
- As referenced in project correspondence in July, 1994, it was discovered that a number of drums excavated from the northern and southern trenches contained elevated levels of DDT which was not previously identified in the RAC Specifications as a contaminant of concern. Additional sampling and analysis of stockpiled materials and excavated soils for these constituents was initiated. A modification to the Sampling and Analysis Plan (SAP) was implemented. Hazard

determinations were performed to identify the appropriate off-site disposal facility for these materials.

- Existing soils at the site were utilized rather than borrow area soils to construct the earthen berms surrounding the soil/waste staging area in Lot 203. Additionally, contaminated soils served as the base in lieu of gravel for protection of the containment cell.
- Trees of harvestable value as determined by the Base Forestry Division, which were cleared during site setup were placed alongside the nearest access road for pickup by the Forestry Division.
- Base personnel determined that the DRMO could accept empty (triple rinsed) 55-gallon drums as a cost savings for off-site disposal.
- Additional Quality Control sampling was requested, approved and amended in the SAP.
- The dimensions of the northern excavation exceeded that of the RAC specifications. The volume of material (soil and debris) requiring excavation exceeded the original estimate by over 300 percent.

7.2 CONTRACT MODIFICATIONS

One no-cost contract modification was submitted for this delivery order.

8.0 FINAL HEALTH AND SAFETY REPORT

8.1 MOBILIZATION AND SITE PREPARATION

The mobilization and site preparation for MCB Camp Lejeune included the following:

- Mobilization and electrical connection of the on-site command center.
- Placement of porta-johns in predesignated locations in accordance with OSHA regulations.
- Placement of the following signs in the appropriate locations in accordance with OSHA regulations:
 - An Employee Right-To-Know poster and station.
 - Material Safety Data Sheets (MSDSs) for all known and suspected on-site chemicals.
 - Hospital route and map posted in the command center and a copy placed in the glove compartments of all site vehicles.
- A Site-specific evacuation plan posted in the command center.
- Exit signs posted in the command center.

Prior to the start of on-site operations, all on-site OHM personnel read, understood and signed the OHM Site-Specific Health and Safety Plan (HASP).

8.2 ON-SITE OPERATIONS

The remediation of drums, ASTs, miscellaneous debris and soil at these sites included:

- Site setup and mobilization
- Clearing and grubbing
- Excavation and staging of drums, ASTs, miscellaneous debris and soil
- Characterization, segregation and bulking of materials
- Loading, transportation and disposal (on and off site) of materials
- Confirmation sampling and backfill of excavations.

Prior to excavation, all utility companies were notified to locate their lines, if any, in the area. Water was made readily available on-site for dust control measures.

The excavation and staging task required Level C or Level B Personal Protective Equipment (PPE) as appropriate. Both levels of PPE included: Tyvek suits and hood, hard hat, safety glasses, steel-toed safety shoes, vinyl booties and an MSA full-face air purifying respirator. For Level C, the respirator was fitted with MSA GMC-H type cartridges. For Level B, the respirator was connected to a source of breathing air. Health and safety issues stressed during the excavation task included good housekeeping, a communication system for site personnel, and shoring and trenching requirements.

Characterization sampling and sampling of soils from the excavations for confirmation analysis required Level C PPE. Safety issues stressed during work activities included good housekeeping, communication with equipment operators and alertness in the proximity of heavy equipment.

The remaining tasks were performed in Modified Level D PPE, which included: hard hat, safety glasses, steel toed boots and cotton gloves. Safety issues stressed during work activities included good housekeeping and communications.

8.3 AIR MONITORING

Air monitoring of the breathing zone for volatile organic compounds (VOCs) and dust was performed during the excavation and loading of the waste. A photoionization detector (PID) was used to identify the VOCs and a Mini-Ram was used to identify air borne particulates. As outlined in the HASP, air monitoring readings and calibration data for the instruments were recorded and documented. The results indicated that no concentrations of dust or VOCs above background levels were identified in the workers' breathing zone during the excavation and loading or the sampling activities. No upgrades of protection were necessary during the course of the project.

8.4 TRAINING REQUIREMENTS

OHM employees, subcontractors and visitors allowed access to work areas were required to have completed the 40-hour health and safety training course for Hazardous Waste Site Operations in accordance with 29 CFR 1910.120 and had to read, understand and sign the HASP.

8.5 ACCIDENTS AND/OR INJURIES

The project was completed without an OSHA Reportable Accident or Lost Time Injury.

9.0 SUMMARY OF RECORD DOCUMENTS

The principal record documents and their status are indicated in the Submittal Status Log, Table 9.1. The table indicates that all necessary documents have been submitted. Copies of some of these documents are provided in the appendices. They are: Waste Shipment Documents, Appendix C; Disposal Certification, Appendix D and Certification of Vehicle Decontamination at the Disposal Facility, Appendix E; QC Analytical Reports, Appendix F; Chains-of-Custody, Appendix G; and Analytical Data, Appendix I.
